It frequently occurs, especially in winter, that the Paris Observatory is not able to make astronomical observations each night. It is therefore necessary to be satisfied with the times registered by the chronometers of which the rate is known for the setting of the clock which sends the signals. These chronometers being sufficiently numerous and accurate, such a procedure causes no inconvenience so long as the cessation of astronomical observations does not exceed a few days. If, on the other hand, the period of cloudy weather continues too long, it is no longer possible to answer for the accuracy of the chronometers. Wireless telegraphy in such cases furnishes a method which allows of the co-operation of other observatories, better situated as regards climatic conditions, in the determination of the state of the master-clock at Paris, and in consequence in the accurate setting of the clock which sends the signals.

Scientific Time Signals.

Preceeding the rhythmic scientific time signals three calls (— • — • —) are made.

Immediately following, a series of 300 dots each formed of a single spark were transmitted, the 60th, 120th, 180th and 240th being suppressed in order to establish the indication for counting purposes.

This series is heard at the observatory in Paris in a wireless receiver and compared with the tickings of a time-keeping clock by the coincidence method. A simple calculation permits of deducing the times (as marked by the clock) from the coincidences of the 1st and 300th dots of the series, which are exact to 1 or 2 hundredths of a second. These may be transformed into " legal time hours " by adding the corresponding correction of the clock.

These latter hours are transmitted by the Eiffel Tower soon after the end of the " ordinary time signals " at night, in the following manner :—

If the times of the 1st and 300th beats are, for instance, 11 hours 30 minutes 8.15 seconds p.m. and 11 hours 35 minutes 1.17 seconds p.m., the two following groups of figures will be twice repeated :—

— • • • — 300815. 350117 — • • • — 300815. 350117
— • • • — 300815. 350117.

In order to know approximately the correction to be made to a clock (or a chronometer) with reference to the legal international time of the observatory, it is sufficient to listen to the ticking of that instrument by means of a microphone suitably attached to a radiotelegraphic receiver at the same time as the series of 300 points are transmitted by the Eiffel Tower. It is necessary to observe and note the coincidences, and then the hours of the clock

(or the chronometer) should be calculated at the moment of the 1st and 300th dots.

By subtracting these times respectively from those sent out by the Eiffel Tower, it is possible to obtain two correcting values for applying to the readings of the clock for measuring time which should be correct to about two hundredths (.02) of a second.

The times of the first and three hundredth beats of the scientific signals are now given in sidereal* time instead of Greenwich mean time. For each series of beats transmitted by Lyons, Paris or Bordeaux, the times of the first and of the three hundredth beat are sent before the following signals from the same transmitter: the time of the beats from Lyons (YN) at 0800 before its French time signals at 0900. Those of the beats from Paris (FL) at 1000 before its French time signals of 1045. Those of the beats from Paris (FL) at 2200 before its French time signals of 2245. Bordeaux (LY) having only one transmission of time signals a day, the times of its beats of each day are sent before its scientific rhythmic signals of the next day.

The changes are the result of the meeting of the International Astronomical Union and their substance is as follows. Signals have hitherto been sent out at definite mean times. In future, beats 1 and 300 of the rhythmic signals will be sent according to Greenwich *sidereal** time. The interval between the beats will be 49/50 of a sidereal second (roughly 44/45 of a mean second, instead of 49/50, as formerly).

For some time after the change the signals will be preceded by the words " sidereal time."

METEOROLOGICAL REPORTS FROM EIFFEL TOWER.

(Call signal FL. Wavelength, 2600 m. spark.)

The meteorological messages from the Eiffel Tower contain observations from 22 French stations (*see* page 1151) and from Brussels, Mayence and other Continental stations, and are issued at the following hours (Greenwich time) :—

0245	Observations at	1h.
0815	,,	7h.
1415	,,	13h.
1930	,,	18h.

The messages are composed of two parts : (i) ordinary observations ; (ii) wind soundings.

NOTE.—As reference is made in this section to " Sidereal Time " the following explanation may be of use to readers :—

The celestial sphere apparently revolves once per day. As all time is measured by regularly recurring phenomena, the interval between two successive returns to a fixed point of this celestial sphere is called a sidereal day. Sidereal time is reckoned from the time when the first point of the constellation Aries passes the meridian.

Our ordinary affairs, however, are regulated by the solar day, which is the interval between two successive transits of the sun's centre over the meridian. If the orbit were not inclined to the equator, and the earth throughout its orbit not in any way influenced by other planets, the intervals between the two transits would be perfectly regular.

However, for reasons which can easily be discovered by the study of astronomical text-books, the intervals between these transits are not regular, and therefore an imaginary " mean sun " is used in astronomical calculations so that the length of the conventional solar day may be kept uniform. This " mean sun " may be supposed to move with uniform velocity, completing its circuit in the same time as the real sun. When the imaginary sun is on the meridian it is the " mean noon " and when the real sun is on the meridian it is " apparent noon."

The solar day is about four minutes longer than the sidereal day for the sun appears to move eastward among the stars at the rate of about one degree a day. About March 21st the solar clock agrees with the sidereal clock, but the sidereal clock gains nearly four minutes every day. At other times there will be considerable differences between the two clocks.

(1) Observations at 7h.

(i) Ordinary observations—code,

Stations 01 to 34	BBBDD	FWTTC	βbbRR	MMmmu
„ 51 to 55	BBBDD	FWTTC	βbbRR	
„ 61 to 64	BBBDD	FWTTC	βbbRR	MMmmu

Note.—The barometer reading for Saentis (a mountain station) which is only included in the reports for 0815 and 1415, is not corrected to mean sea-level.

The symbols have their usual significance, according to International Code, but barometric values are expressed in millimetres and tenths.

Eiffel Tower Code for Upper Winds.

(ii) Wind soundings–stations 01 to 34.

Code : Two groups of 6 letters for each station :—

$D_1\ V_1\ D_2\ V_2\ D_3\ V_3$ $D_4\ V_4\ D_5\ V_5\ D_6\ V_6$

$D_1\ D_2\ D_3\ D_4\ D_5\ D_6$ Indicates the direction of the wind at the different altitudes.

$V_1\ V_2\ V_3\ V_4\ V_5\ V_6$ Indicates the force of wind at different altitudes.

D_1 and V_1 at 500 metres.
D_2 and V_2 „ 1,000 „
D_3 and V_3 „ 1,500 „
D_4 and V_4 „ 2,000 „
D_5 and V_5 „ 3,000 „
D_6 and V_6 „ 4,000 „

For upper winds the following code is used :

Direction of Wind.

NNE	a	SSW	i
NE	b	SW	j
ENE	c	WSW	k
E	d	W..	l
ESE	e	WNW	m
SE	f	NW	n
SSE	g	NNW	o
S	h	N	p

Metres per second :— *Speed of Wind.*

0	a	26	n
2	b	28	o
4	c	30	p
6	d	32	q
8	e	34	r
10	f	36	s
12	g	38	t
14	h	40	u
16	i	42	v
18	j	44	w
20	k	46	y
22	l	48	z
24	m		

Letter x denotes missing observations.

(2) Observations at 13 h.

Parti (i)—Stations 01 to 34.

Station number (two figures) :—BBBDD FWTT βbb

Stations 51 to 55.

Station number (two figures) :—BBBDD FWTTC

Part (ii)—Wind soundings in the same code as at 7h. (stations 01 to 34 only).

(3) OBSERVATIONS AT 1 H. AND 18 H. (Stations 01 to 34 only).

Part (i)—Station number (two figures):—

BBBDD FWTT βbb

Part (ii)—Wind soundings in same code as at 7h.

NOTE.—After the data groups in the 1h. message follows a forecast for the day "*en clair*," based on the 18h. observations of the previous evening.

The telegrams commence by the words:—

Météo France.

The groups of figures and the groups of letters for each station are preceded by a group of two figures indicating the station.

Missing stations are shown by five x's—x x x x x preceded by the number of the station.

Groups of figures are given for the following stations:—

01	Rochefort.	15	Paris (Dugny).	33	Privas.
02	Biarritz.	18	Rennes.	34	Romilly.
03	Bordeaux.	19	Strasbourg.	51	Zurich.
04	Brussels.	21	Toulouse.	52	Berne.
07	Dijon.	22	Tours.	53	Geneva.
08	St. Inglevert (Calais)	27	Alençon.	54	Lugano.
09	Limoges.	28	Amiens.	55	Saentis.
10	Lyons.	29	Cosne.	61	Utrecht.
11	St. Mathieu.	30	Le Havre.	62	Helder.
13	Mayence.	31	Istres.	63	Flushing.
14	Montpellier.	32	Metz.	64	Groningen.

Groups of letters are sent for the following stations:—

03	Bordeaux.	15	Paris.
04	Brussels.	17	St. Pierre Quiberon.
14	Montpellier.	19	Strasbourg.

EUROPEAN WEATHER REPORT.

(Issued from Eiffel Tower (FL) at 11.30 a.m. G.M.T.)

The message commences with the letters "ONM" (Office Nationa Meteorologique, Meteo, Europe) and 40 series of three groups consisting of 2, 5 and 3 figures respectively, giving 7h. observations for the following stations:—

01	Paris.	23	Dantzig.
02	Madrid.	24	Tynemouth.
03	Vienna.	25	Perpignan.
04	Stockholm.	26	Skudesnaes.
05	Stornoway.	27	Corunna.
06	Clermont-Ferrand.	28	Florence.
07	San-Fernando.	29	Fano.
08	Munich.	30	Mahon.
09	Haparanda.	31	Cracow.
10	Thorshavn.	32	Holyhead.
11	St. Mathieu.	33	Berne.
12	Algiers.	34	Helder.
13	Warsaw.	35	Parata.
14	Bronno.	36	London.
15	Blacksod Point.	37	Hamburg.
16	Biarritz.	38	Ile D'Aix.
17	Tunis.	39	Brussels.
18	Prague.	40	Valencia.
19	Vardo.	41	Rabat } Do not yet
20	Seydisfjord.	42	Lisbon } appear in
21	Scilly.	43	Horta } the message.
22	Nice.		

Code :—Station number (two figures) BBBDD FNb.

N = characteristic of barometric tendency, embodying state of the sky.

0 =	positive	tendency	with	sky	clear.	
1 =	,,	,,	,,	,,	¼ covered with cloud.	
2 =	,,	,,	,,	,,	½ ,,	,,
3 =	,,	,,	,,	,,	¾ ,,	,,
4 =	,,	,,	,,	,,	overcast.	
5 =	negative	,,	,,	,,	clear.	
5 =	,,	,,	,,	,,	¼ covered with cloud.	
7 =	,,	,,	,,	,,	½ ,,	,,
8 =	,,	,,	,,	,,	¾ ,,	,,
9 =	,,	,,	,,	,,	overcast.	

b = amount of barometric tendency in half millimetres.
For tendencies 10 to 19 the second figure only is reported, and 33 is added to the wind direction number.
For tendencies 20 to 29 the second figure only is reported, and 67 is added to the wind direction number.

Then follows "*en clair*" (i) the general situation at 7h.; (ii) a detailed forecast for France based on 7h. charts covering the period up to the following morning, and (iii) an indication of the probable weather for the following day.

NOTE.—The order of the stations is such that if only one part of the message is received it may yet give a fair representation of the Chart.

Other meteorological reports are issued as follows :—

(1) Transmitting station—Dugny (call signal, ZM).
Wavelength 1400 m. C.W. (for reports issued at 0645 G.M.T.).
,, 1680 m. C.W. (,, ,, 1155 G.M.T.).

Times of sending, 0645 G.M.T. (Observations at 6h.).
,, ,, 1155 G.M.T. (Observations at 9h., and Paris Observations at 11h.).

Code : Station letters (2) DDFW βbbV W¹n
where DDFW βbb have the same significance as in International Code :—

V = visibility : distance expressed in km. from 0 to 9. The figure 9 expresses a good visibility equal to or better than 9 km.

W ¹ = letters of weather, thus :—

sky cloudless, or less than ¼ covered	b
,, ½ covered	bc
,, ¾ covered	c
,, overcast	o
gloomy	g
threatening appearance	u
wet air without rain	e
rain	r
drizzle	d
snow	s
showers	p
hail	h
squally	q
lightning	l
thunder	t
thunderstorm	tlr
fog	f
wet fog	fe

mist....	m
haze	z
heavy dew	w
hoar frost	x
dry air (humidity less than 60 per cent.)	y
exceptional visibility	v

n = figure for clouds, one or several (as on page 1124). Code 2, Route Weather Reports.

PILOT BALLOON ASCENTS (these are included from certain stations).

Code :—Station letters (2) h DDvvR DDvvR DDvvR
where h = height of cloud layer, thus :—

1 = from 250 to 500 m.
2 = ,, 500 ,, 750 m.
3 = ,, 750 ,, 1,000 m.
4 = ,, 1,000 ,, 1,500 m.
5 = ,, 1,500 ,, 2,000 m.
6 = above 2,000 m.

DD = direction of wind (scale 1 to 32).
vv = velocity of wind in m/sec.
R = characteristic of regularlty in wind, thus :—

0 = regular in speed and direction.
1 = ,, ,, irregular in direction.
2 = irregular in speed, regular in direction.
3 = ,, ,, and direction.
4 = changing direction sharply.
5 = ,, speed sharply.

NOTE.—The message includes a forecast for the whole of France for the morning (at 0800) and afternoon (at 1130) respectively.

STATION IDENTIFICATION LETTERS.
DUGNY MESSAGES.

PA = Paris (Dugny).
AA = Amiens.
AC = Gris-Nez.
AD = Le Crotoy.
AE = Lille.
AG = Rouen.
CC = Alençon.
CD = Chartres.
DA = Chalons s/Marne.
DD = St. Dizier.
EA = Malzeville.
EC = Neufchateau.
EP = Epinal.
FA = Rennes.
FC = Cherbourg.
FD = St. Mathieu.
FE = Lorient.
HA = Dijon.
HC = Luxeuil.
JA = Strasbourg.
JB = Mulhouse.
JF = Mayence.
JI = Thoinville.
JL = Frescaty (Metz).
JK = Bitche.
LA = Tours.
LB = Poitiers.
LC = Chateauroux.
LD = Angers.
MA = Avord.
MB = Limoges.
MC = Clermont-Ferrand.
MD = Puy-de-Dome.
ME = Cosne.
NA = Lyon.
NB = St. Julien en Genevois.
NC = Privas.
OA = Bordeaux.
OB = Biarritz.
OC = Cazaux.
OD = Angouleme.
OF = Rochefort.
OG = La Coubre.
QA = Toulouse.
QC = Pau.
QI = Bagneres de Bigorres.
QL = Pic du Midi.
RA = Montpellier.
RC = Istres.

(2) Transmitting station—Le Bourget (call signal ZM).
Wavelength, 1680 m. C.W.

Times of sending 0730 G.M.T. (Observations at 7h. G.M.T.).
,, ,, 0830 ,, (,, 8h. ,,).
,, ,, 0930 ,, (,, 9h. ,,).
,, ,, 1030 ,, (,, 10h. ,,).
,, ,, 1130 ,, (,, 11h. ,,).
,, ,, 1230 ,, (,, 12h. ,,).
,, ,, 1330 ,, (,, 13h. ,,).
,, ,, 1530 ,, (,, 15h. ,,).
,, ,, 1630 ,, (,, 16h. ,,).

Observations relate to the following stations. The index letter is given in brackets :—Le Bourget (P1), Le Havre (P5), Abbeville (P3), St. Inglevert (P2), Maubeuge (P4), Le Crotoy (AD), Compiègne (CO).

Code: as for British hourly reports, except that the following code is used for present and also past weather :—

00 = sky almost cloudless.	43 = squalls.
01 = sky $\frac{1}{4}$ clouded.	44 = gale.
02 = sky $\frac{1}{2}$ clouded.	45 = gloom.
03 = sky $\frac{3}{4}$ clouded.	46 = ugly, threatening.
04 = overcast, but small amount of blue visible.	49 = thunder and lightning (no rain).
05 = entirely overcast.	78 = drizzle.
17 = slight fog.	81 = rain or showers.
19 = fog.	84 = hail.
20 = wet fog.	87 = sleet.
30 = wet air.	90 = snow.
32 = dust haze.	93 = thunderstorm without hail.
33 = dew.	96 = thunderstorm with hail.
34 = hoar frost.	98 = line squall.

(3 & 4)

Transmitting station	Cherbourg	.... Brest.
Call signal	FUC	.... FUE
Wavelength	2,800 m. C.W.	.... 2,800 m. C.W.
Times of sending	0800 G.M.T.	.... 0810 G.M.T.
,, ,, ...	1400 G.M.T.	.... 1410 G.M.T.
,, ,, ...	1830 G.M.T.	.... 1840 G.M.T.

Observations at .... 7h. 13h. 18h. respectively.

The messages begin, " Meteo Cherbourg " and " Meteo Brest."

OBSERVATIONS AT 7h.

Code : BBBDD FWTTC βbbRR MMnnV pilot ADDVV ADDVV, etc.

OBSERVATIONS AT 13h. AND 18h.

Code : BBBDD FWβbb Vis (visibility as in British Reports).

Observations in Old International Code.

Pilots in Code A 1 = 200 m., 2 = 500 m., 3 = 1,000 m., 4 = 1,500 m. 5 = 2,000 m., 6 = 3,000 m., 7 = 4,000 m., 8 = 5,000 m.

(5 & 6)

Transmitting station	Porqueroles (near Toulon).	Toulon.
Call signal	FUQ	.... FUT
Wavelength	1,350 m. spark	1,350 m. spark.
Times for sending	0915 G.M.T.	1900 G.M.T.
Observations at	0700 G.M.T.	1800 G.M.T.

The messages begin with words, " Meteo Mourillon."

0700 observations from 1, Cap Bear ; 2, Cette ; 3, Aubagne ; 4, Toulon ; 5, St. Raphael ; 6, Ajjacio.

Code : BBBDD FWTTC βbbRR MMnmu

Pilots from : 1, Aubagne ; 2, St. Raphael.

Code : DDVV DDVV for heights 500, 1,000, 1,500, 2,000 metres.

1800 observations from same stations as 0915 message.

Code : BBBDD FWTTC βbb

Pilots as for 0700.

FRENCH OCEANIA

The Papeete station (Tahiti Is.) transmits every day, including holidays, on the wavelength of 600 metres, two meteorological reports, one at 11 a.m. and the other at 11 p.m. (G.M.T.), which are made up as follows:—

I.

The reports contain the date of the report of the meteorological station of Point Venus, followed by a group of 8 figures in normal code: BBBDDFWS.

The report is preceded by the following signal: "Tahiti observatoire."

II.

Notice to navigators concerning alterations of lightship or light buoys, the presence of derelicts, and the disappearance of light buoys or important buoys, and any other information in regard to navigation, will be added, as occasion arises, in the report. It will be sent out in French and English.

III.

The reports will be transmitted three times in succession; the first time transmission will be made rapidly, the second and third times slowly.

IV.

A safety signal will be transmitted to ships at any hour of the day or night, repeated at short intervals ten times on full power: Tahiti T.T.T., followed by advice of cyclones, typhoons or derelicts, or any sudden changes in the position or form of fixed obstructions or of land marks. The message will be repeated three times with intervals of ten minutes.

There is a meteorological station on a small scale in the New Hebrides on the Island of Iririki in Vila Harbour, and the observations recorded are communicated to the Commonwealth Meteorologists at Melbourne, Australia. and rainfall to British Meteorological Office, London.

GERMANY

The Nauen high-power station at present broadcasts time signals at noon and midnight (G.M.T.) 0100 and 1300 standard mean time on a wavelength of 3,100 m. undamped musical in accordance with the International Time Conference.

This station further transmits at 0900 and 1940 (G.M.T.) "*International Weather Reports*" from observations at 7h. and 18h. respectively.

The observations for 0700 are sent at 0900 in the code

BBBDD FWTTC βbbRR MMmmu

and the observation for 1800 are sent at 1940 in the code

BBBDD FWTTW[1] where W[1] refers to past weather.

The stations used are Borkum, Keitum, Hamburg, Swinemunde, Neufahrwasser, Memel, Aachen, Hanover, Berlin, Dresden, Breslau, Karlsruhe, Frankfürt, Munich, Vienna.

Since May, 1919, the high-power wireless station of Nauen, on a request from a British source of the then Armistice Commission, sends out twice daily (10 a.m. and 8.40 p.m.) on a wavelength of 4,700 m. undamped, for reception in England and France, a collective telegram of German weather observations drawn up by the German Marine Observatory, Hamburg.

(1) INLAND METEOROLOGICAL SERVICE.

The weather reports of the German Marine Observatory are forwarded direct by wireless from Hamburg to the Chief Wireless Station of the Chief Telegraph Office in Berlin, whence they are at present sent by distant control and wireless telegraphy four times daily *via* the main wireless station at

Königs Wusterhausen. The "Upper Air" reports of the Lindenburg Aeronautical Observatory are received through the telephone by the main wireless station of Königs Wusterhausen and are reforwarded thence by wireless.

Transmitting station.—Königs-Wusterhausen (call signal LP).

Wavelength, 3,200 m. C.W.

Times of sending.—6035, 0940, 1550 (G.M.T.).

The messages are synoptic reports of aircraft and captive balloon observations made at Lindenberg and coded according to the Lindenberg code.

They are in two parts:—

(i) Wind in the upper atmosphere.

(ii) Captive-balloon observations.

LINDENBERG CODE.

The code for (i) is as follows:—

ZZwVβ h_1h_1DDv h_1h_1DDv addS_2

where ZZ = time in whole hours from 00 to 23.

(00 = 23 h. (G.M.T.); 01 = 24 h. (G.M.T.); 02 = 1 h. (G.M.T.) etc.)

w = present weather in old international code.

V = horizontal visibility, the scale being:

0 = less than 20 metres.		5 = up to	1 km.
1 = up to	50 metres.	6 = ,,	5 ,,
2 = ,,	100 ,,	7 = ,,	10 ,,
3 = ,,	200 ,,	8 = ,,	20 ,,
4 = ,,	500 ,,	9 = ,,	50 ,,

β = barometric tendency during 3 hours previous to transmission of report.

0 = no change		(less than 0·5 mm.).
1 = falling slightly		(0·5-1·4 mm.).
2 = ,,	gradually	(1·5-2·4 mm.).
3 = ,,	rapidly	(2·5-3·4 mm.).
4 = ,,	very rapidly	(greater than 3·4 mm.).
5 = rising slightly		(0·5-1·4 mm.).
6 = ,,	gradually	(1·5-2·4 mm.).
7 = ,,	rapidly	(2·5-3·4 mm.).
8 = ,,	very rapidly	(greater than 3·4 mm.).
9 = unsteady or impossible to report.		

h_1h_1 = altitude above sea-level in hundreds of metres (00 = ground level).

DD = direction of wind at each height (scale 0-32, international code).

v = single figure for wind velocity
for velocities 10 to 19, 33 is added to DD.
,, ,, 20 to 29, 67 ,, ,,
,, ,, above 29, the velocity is given in words (000 = calm.)

addS_2 If the final group has only 4 figures it will be a cloud symbol, code, a 1 = Ci; 2 = Ci-St; 3 = Ci-Cu; 4 = A-Cu.

dd = direction of cloud (0-32, international code)

$$S_2 = \frac{\text{angular velocity}}{\text{altitude}}$$

The code for (ii) is

h_1h_1TTT HHDDv h_1h_1TTT HHDDv ZZwVβ

where

h_1h_1 = height above mean sea-level in hundreds of metres.

TTT = temperature in tenths of degrees centigrade

HH = relative humidity as % (98 = 100%; 99 = no report).

A special wireless system exclusively for the use of aviation does not exist. The radio traffic for the purposes of airship traffic is at present

restricted to the forwarding of single telegrams (weather reports, starting and landing reports) by the wireless stations of the Imperial wireless system. The weather reports of the German Marine Observatory and the "altitude" observations (Hohenbeobachtungen) of the Lindenberg Aeronautical Observatory broadcasted by the Königs Wusterhausen chief wireless station, contribute to the safety of aerial navigation.

Ship Weather Service.

Since the 1st January, 1920, the chief wireless station of Norddeich broadcasts daily after the Nauen time signal at one o'clock p.m. on a wave of 600 m. (musical spark) a weather telegram giving the state of the weather and a weather forecast for the next 24 hours, destined for ships in the North Sea. Norddeich also sends, as required and on the same wavelength, storm warnings which are repeated at 6 p.m. A similar news service for the Baltic coastal territory has recently been instituted experimentally at the wireless coast stations of Swinemunde and Pillau. *The supply, against payment, of weather reports by coast stations to passing ships, at the request of the latter, has not again been instituted.*

Important News for Mariners: Ice Reports.

The coast stations of Norddeich, Swinemunde and Pillau, send out as required and by wireless telegraphy "Important news for mariners" regarding the breaking away of light ships, etc. The messages, which are sent on a wavelength of 600 m. (musical spark), are transmitted three times immediately after they have been received at the coast station, and as long as may be necessary, are repeated three times after the weather telegrams. The Nauen high-power station sends ice reports in cipher after the weather telegrams. The same reports, however, are sent out in plain language by the wireless coast stations of Norddeich and Swinemunde after the weather telegram.

Borkum KBM (position 53° 35′ N.; 6° 40′ E.) sends out at 0300, 0700, 1100, 1500, 1900, 2300 G.M.T. on 600 m. wavelength warnings respecting mines.

GIBRALTAR

Transmitting station: Gibraltar (call signal BWW).

Wavelength: 4,800 m. C.W.

Times of sending: (G.M.T. 0730) (observations at 21h and 7h).
(G.M.T. 1840) (,, ,, 13h and 18h).

Code for 0730 report
BBBDD FFWTT BBBDD FFWTT 999RR MMmmu

Code for 1840 report
BBBDD FFWTT 999UC BBBDD FFWTT bbuMM

Note.—Barometer in inches and hundredths; wind-force (2 fig) Beaufort scale 0-12; rainfall in inches and hundredths.

GREAT BRITAIN

Collective data messages are issued four times daily, from the Air Ministry, picked up by Aberdeen and retransmitted. Information in these synoptic messages include temperature, humidity and visibility observations.

On and after September 1st, 1921, the synoptic reports* for British stations, issued by wireless telegraphy, will be as follows:—

* A synoptic chart gives a general or "bird's-eye" view of the weather at a certain definite time over a large area.

Air Ministry, London.

Call sign: G.F.A.

Wavelength: 1,400m. continuous wave.

Times of issue:	0200 (G.M.T.)	(Observations of	0100 G.M.T.)
,, ,,	0800 ,,	,, ,,	0700 ,,
,, ,,	1400 ,,	,, ,,	1300 ,,
,, ,,	1900 ,,	,, ,,	1800 ,,

Aberdeen.

Call sign: B.Y.D.

Wavelength: 3,300 m. continuous wave.

Time of issue: 0830 (G.M.T.) (Observations of 0700 (G.M.T.)

The reports will be sent in the code recommended at the third meeting of the Commission for Weather Telegraphy, held in London in November, 1920. The messages will consist of three parts:—

i. Surface observations and cloud reports.
ii. Upper winds (speeds in miles per hour for the present).
iii. Upper air temperatures and humidities.

In the first part of the message the index figures for each station will be followed by groups of five figures, giving the surface observations and the cloud observations for the station.

In the second part of the message the index figures for each station will be followed by three groups of five figures, giving the upper wind for that station at three selected heights.

In the third part of the message the index figures for each station will be followed by a number of five-figure groups giving the temperature and humidity and pressure at different heights.

For security the second part of the message will be preceded by the word "PILOT," and the third part of the message by the word "TEMP."

NEW INTERNATIONAL CODE.

If I_1I_1 I_2I_2 I_3I_3 etc., are the index groups of stations, then the symbolic form of the messages will be:—

I_1I_1 BBBDD FwwTT cbWVH ALaNh RRjjr C_1ddVV.
I_2I_2 BBBDD, etc.
I_3I_3 BBBDD, etc.
Pilot I_1I_1 $h_1$ddvv $h_1$ddvv $h_1$ddvv
I_2I_2, etc.
I_3I_3, etc.
Temp. I_1I_1 BBTTH, etc.
I_2I_2 BBTTH, etc.
I_3I_3 BBTTH, etc.

A hyphen - (Morse signal ▬ ● ● ● ▬) will be used in the place of any missing figure.

BBB = Barometer in millibars and tenths (initial 9 or 10 omitted).

DD = Direction of the wind near the ground on the scale 01-32 (Code 1).

F = Force of the wind on the Beaufort scale. (Forces above 10 reported as 9 in the telegrams with the actual force in a word at the end, *e.g.*, force 10 is reported at the end as "storm ten"; force 11 as "storm eleven").

ww = The actual weather at the time of observation, with which is combined, whenever possible, the general character of the weather (Code 2).

TT = Temperature of the air in whole degrees Fahrenheit.

c = Characteristic of barometric tendency during the period of three hours preceding the time of observation (Code 3).

b = Amount of barometric tendency in the same period of three hours expressed in half-millibars. For tendencies 10-19, the *second* figure only is reported, and 33 is added to the wind direction number. For tendencies 20-29 the second figure only is reported, and 67 is added to the wind direction number. Tendencies greater than 29 are reported as 29 (Code 4).

W = The weather in the interval since the preceding time of report (Code 5).

V = Visibility or distance at which objects can be seen in daylight (or at which lights can be seen at night) (Code 6).

H = Relative humidity of the air (Code 7).

A = Form of *predominating cloud lowest* in the scale of cloud forms (Code 8).

L = Amount of sky (0-10) covered by cloud of form A and of all forms of the same layer as A, if "a" refers to a different layer.

a = Form of *predominating cloud highest* in the scale of cloud forms when more than one type of cloud exists (Code 8).

N = Total amount of sky covered with cloud (scale 0-10).

h = Height of base of lowest cloud present (Code 9).

RR = Rainfall in whole millimetres (Code 10).

jj = The meaning of the letters "jj" varies with the time of report, and between coast stations and inland stations. From coast stations figures giving the state of the sea and the visibility towards the sea are inserted for "jj." From inland stations in the reports at 0700, the minimum temperature during the night is inserted for "jj," and for reports at 1800 the maximum temperature during the day is inserted for "jj."

r = Time of commencement of rainfall (precipitation) (Code 11).

C_1 = Form of cloud observed by nephoscope for special cloud reports (Code 8).

dd = Direction of the wind in the upper air on the scale 01-36 (*i.e.*, degrees from north divided by 10 and rounded off to the nearest whole number) (00 - calm).

VV = The relative speed of clouds as determined by nephoscope, and such that if "h" is the height of the cloud in metres, the actual speed "vv" in kilometres per hour is obtained from the equation—

$$vv = \frac{h}{1000} \times VV$$

h_1 = Height at which the upper wind is reported (Code 13).

dd = Direction of the wind in the upper air on the scale 01-36.

vv = Speed of the wind in the upper air in miles per hour.

NOTE.—The speed of the upper air will continue for the present to be given in m.p.h., as the introduction of kilometres per hour involves certain changes which it has not yet been possible to carry out.

BB = Barometer in whole millibars (initial 9 or 10 omitted).

H_1 = Height at which upper air temperature and humidity are reported (Code 14).

The necessary codes are given in the attached appendix.

The list of stations, with the latitude and longitude and approximate height above mean sea level, is given below. Stations which will be used at present for surface observations are printed in capital letters.

Coast station = (S), Land station = (L).

Index No.		Latitude.	Longitude.	Height above Mean Sea Level.

CODE 3 (c).

Code for Characteristic of Barometric Tendency.

Code	Symbol	Characteristic	
0 =	o or +	Steady or rising	The barometer is now higher than, or the same as, three hours ago.
1 =	+ o	Rising then steady	
2 =	+ −	Rising then falling	
3 =	− + or o +	Falling or steady then rising	
4 =	Unsteady	Unsteady but rising	
5 =	−	Falling	The barometer is now lower than, or the same as, three hours ago.
6 =	− o	Falling then steady	
7 =	− +	Falling then rising	
8 =	o − or + −	Steady or rising then falling	
9 =	Unsteady	Unsteady but falling	

CODE 4 (b).

Code for Amount of Barometric Tendency.

Only the units figure of the amount (half-millibars per three hours is reported, and 33 is added to the wind direction number for tendencies of 10-19. Similarly, 67 is added for tendencies of 20-29. Tendencies above 29 are given as 29.

The "characteristic" indicates whether the tendency is positive or negative.

CODE 5 (W).

Code for Past Weather.

Without precipitation	0 = Fair or fine (*b* or *bc*).
	1 = Cloudy.
	2 = Overcast continuously.
	3 = Fog or mist.
	4 = Thick fog.
Precipitation	5 = Passing showers.
	6 = Rain or drizzle.
	7 = Snow or sleet.
	8 = Hail or rain and hail.
	9 = Thunderstorm.

In using this code the largest number is taken which describes a feature of the past weather not already reported by the two figures for "present weather and general character." In any case in which the two figures "for present weather and general character" describe fully the past weather also, then the appropriate single past weather figure is reported in confirmation, *e.g.*, in the case of heavy continuous rain without fog or mist the present weather figures would be 59 and the past weather figure would be 6.

CODE 6 (V).

Code for Visibility.

Code Number.			
0	Objects not visible at	50 metres.	
1	,, ,, ,,	200 ,,	
2	,, ,, ,,	500 ,,	
3	,, ,, ,,	1,000 ,,	
4	,, ,, ,,	2,000 ,,	
5	,, ,, ,,	4,000 ,,	
6	,, ,, ,,	10,000 ,,	
7	,, ,, ,,	20,000 ,,	
8	,, ,, ,,	50,000 ,,	
9	,, visible at	50,000 ,,	or above.

CODE 7 (H).

Code for Relative Humidity.

Code Figure.	Relative Humidity.
0	95–100 per cent.
9	90– 94 ,,
8	80– 89 ,,
7	70– 79 ,,
6	60– 69 ,,
5	50– 59 ,,
4	40– 49 ,,
3	30– 39 ,,
2	20– 29 ,,
1	10– 19 ,,

CODE 8 (A, a, C_1).

Code for Form of Cloud.

Code Number.	Form of cloud.
1	Ci.
2	Ci. St.
3	Ci. Cu.
4	A-Cu.
5	A.St.

6	St. Cu. (Mammato-Cumulus is reported by the figures for the type of cloud in which the mamma!o form occurs).
7	Nb.
8	Cu. or Fr. Cu.
9	Cu. Nb.
0	St. or Fr. St.

CODE 9 (h).

Code for height of base of Lowest Cloud.

Code Number.		Height of Base of Cloud.
0	0– 50 metres	0– 150 feet.
1	50– 100 ,,	150– 300 ,,
2	100– 200 ,,	300– 600 ,,
3	200– 300 ,,	600–1,000 ,,
4	300– 600 ,,	1,000–2,000 ,,
5	600–1,000 ,,	2,000–3,000 ,,
6	1,000–1,500 ,,	3,000–5,000 ,,
7	1,500–2,000 ,,	5,000–6,500 ,,
8	2,000–2,500 ,,	6,500–8,000 ,,
9	No low cloud	No low cloud.

CODE 10 (RR).

Code for Amount of Rainfall.

Amounts are given in whole millimetres, but for amounts 0 1 0 0.6 mm., the following code is used :—

91 = 0.1.
92 = 0.2.
93 = 0.3.
94 = 0.4.
95 = 0.5.
96 = 0.6.
97 = Some rain but not measurable.
98 = More than 90 millimetres.
99 = Measurement impossible or un eliable

CODE 11 (r).

Code for Time of Beginning of Rainfall.

0 = No rain.
1 = 0–1 hours before the time of observation.
2 = 1–2 ,, ,, ,,
3 = 2–3 ,, ,, ,,
4 = 3–4 ,, ,, ,,
5 = 4–5 ,, ,, ,,
6 = 5–6 ,, ,, ,,
7 = 6–8 ,, ,, ,,
8 = 8–10 ,, ,, ,,
9 = Above 10 ,, ,, ,,
– = No observation.

CODE 12 (S).

Code for State of Sea and Character of Swell.

0 = No swell .... 1 = Moderate swell 2 = Heavy swell	Calm or slight sea.
3 = No swell .... 4 = Moderate swell 5 = Heavy swell	Moderate sea.

6 = Rather rough sea.
7 = Rough sea.
8 = Very rough sea.
9 = Mountainous sea.

CODE 13 (h_1).

Code for Height of Upper Wind.

Code Number.	Height. International Specification.	Corresponding height used for British Reports.
1	200 metres	1,000 feet.
2	500 ,,	2,000 ,,
3	1,000 ,,	3,000 ,,
4	1,500 ,,	5,000 ,,
5	2,000 ,,	7,000 ,,
6	3,000 ,,	10,000 ,,
7	4,000 ,,	13,000 ,,
8	5,000 ,,	17,000 ,,
9	6,000 ,,	20,000 ,,

CODE 14 (H_1).

Code for Height of Upper Air Temperature and Humidity.

The figure groups refer to the following heights and are sent in fixed order.

Heights.
(International Specification.)

Height	
200 metres	Above ground.
500 ,,	Above ground.
1,000 ,,	Above mean sea level.
1,500 ,,	Above mean sea level.
2,000 ,,	Above mean sea level.
2,500 ,,	Above mean sea level.
3,000 ,,	Above mean sea level.
4,000 ,,	Above mean sea level.
5,000 ,,	Above mean sea level.
6,000 ,,	Above mean sea level.

HOURLY REPORTS.

These are now issued in the revised code forms adopted by the International Commission for Weather Telegraphy at the meetings in London in September, 1921.

Hourly reports are issued daily from the Air Ministry, Sundays included at 35 minutes past each hour from 0735 to 1635 (G.M.T.) by wireless telegraphy (giving the results of observations taken 35 minutes previously) as follows :—

Call sign .. .. GFA.
Wavelength .. .. 1680 m. (c.w.)

After the call sign GFA comes the word " METEOR," indicating that a meteorological message is being transmitted. This is followed by one four-figure group, giving the hour (G.M.T.) at which the observations were made : this time group will be followed by a series of figure groups indicating the stations and conditions thereat. The group giving the index number will consist of two figures (three figures in the case of a station reporting sea visibility). This group will be followed by groups of five figures giving the meteorological conditions at the stations :—

Index Figures.	*Station.*
61	Croydon.
62	Biggin Hill.
66	Lympne.
75	Beachy Head.
76	Dungeness.

In the case of DUNGENESS (76) only one group will be sent, including the index figures and the Channel visibility there, while in the case of Lympne the last figure of the first group will give the Channel visibility from HYTHE.

The word "BOTLEY" when it occurs in a message is followed by a statement in plain language of the conditions on the North Downs (Botley Hill), as viewed from Biggin Hill, when such a statement adds material information to that contained in the rest of the message.

At the end of the messages issued at 0835, 1135 and 1435 a short forecast will be given in plain language of the meteorological changes anticipated in S.E. England in the period of daylight following the time of issue.

This will begin with the word "FORECAST."

The complete results of a pilot balloon ascent at Croydon or Lympne, when available, will be given at the end of the messages at 0735, 1135 and 1335. This part of the message will be preceded by the index figures of the station and by the four figure index group 49tt—where tt = hour of ascent (G.M.T.).

The groups following the index group will be in the form $h_1$ddvv where h_1 is the height according to the following scale :—

1 refers to a height of		200	metres or	500	feet.
2	,,	,,	500	,,	1,500	,,
3	,,	,,	1,000	,,	3,000	,,
4	,,	,,	1,500	,,	5,000	,,
5	,,	,,	2,000	,,	7,000	,,
6	,,	,,	3,000	,,	10,000	,,
7	,,	,,	4,000	,,	13,000	,,
8	,,	,,	5,000	,,	16,000	,,
9	,,		6,000	,,	20,000	,,

dd is the direction of the wind on the scale (01—36) at the height h_1, *i.e.*, degrees from North divided by 10 and rounded off to the nearest whole number (00 = calm).

vv is the speed of the wind in miles per hour.

NOTE.—If no ascent is possible before 0735, the results of a later ascent will be added to the message at 0935, if then available.

Additional Reports from Stations outside S.E. England, from the Azores and from Ships at Sea.

(*a*) Reports from stations which are received too late for inclusion in the general synoptic messages issued by wireless telegraph from the Air Ministry at 0800 and 1400 will be added to the 0835 and 1435 route reports after the forecast.

(*b*) Reports from Valencia, Plymouth and Calshot for 1000 G.M.T. will be added at the end of the 1035 route report.

The above reports will be sent in the following (normal) code :—

BBBDD FwwTT cbWVH ALaNh RRmmr for land stations.
BBBDD FwwTT cbWVH ALaNh RRSV$_s$r for coast stations.

(*c*) The 0700 observations (3 groups for each station) from the Azores (Horta and Ponta Delgada) will be added to the first route report sent after the reception of the observations at the Meteorological Office, London. The groups will be preceded by the words "Horta" and the letters "P.D." respectively.

(*d*) In the same way reports received from ships at sea will be added to

the next hourly route report issued after these reports have been received. They will be sent in the code

$QLLLx_1$ $llllx_2$ $BBDDx_3$ $FVKdx_4$ $wwGGx_5$
$TTttx_6$ $CNWrx_7$ $y_1y_2y_3y_4y_5$

CODES.

The standard form is I_1I_1 (V_s) wwVhL $NDDFW_1$

This is used for all stations for observations at all times except 0700, 1000, 1300 and 1600.

For observations at 0700, 1000, 1300 and 1600 two forms are used :—

(*a*) *At non-synoptic stations* (Biggin Hill (62) and Beachy Head (75) the same code is used as at other hours, with the addition of a fourth group represented symbolically by $CddF_1S$. Thus for these stations reports at 0700, 1000, 1300 and 1600 will be in the form

I_1I_1 (V_S) wwVhL NDDFW $CddF_1S$

(*b*) *At synoptic stations* (Croydon (61) and Lympne (66)) the general code is used with the addition of the same group, $CddF_1S$. Thus for these stations the reports at 0700, 1000, 1300 and 1600 will be in the form

I_1I_1 (V_S) BBBDD FwwTT cbWVH ALaNh $CddF_1S$

The meaning of the symbols is as follows :—

I_1I_1 = index figures of station.

V_S = visibility towards the sea (*see* Code 6).

BBB = barometer in millibars and tenths (initial 9 or 10 omitted). The values refer to sea-level and include all corrections for index error, temperature and gravity.

DD = direction of the wind near the ground on the scale (01 to 32) in which 08 = East, 16 = South, etc., 00 = calm.

F = force of the wind on the Beaufort Scale.

ww = the actual weather at the time of observation, with which is combined, whenever possible, the general character of the weather (*see* Code 2 New International Code above).

TT = temperature of the air in whole degrees Fahrenheit.

c = characteristic of barometric tendency during the period of three hours preceding the time of observation.

b = amount of barometric tendency expressed in half millibars. For tendencies 10 to 19 the *second* figure only is reported and 33 is added to the wind direction number. For tendencies greater than 29 the second figure only is reported and 67 is added to the wind direction number. Tendencies greater than 29 are reported as 29.

W = the weather in the interval since the time of preceding report (*see* Code 5 New International Code above).

V = visibility, or distance at which objects can be seen in daylight (*see* Code 6).

H = relative humidity of the air.

A = form of *predominating cloud lowest* in the scale of cloud forms (*see* Code 2).

L = amount of sky (scale 0 to 10) covered by cloud form A and all forms of the same layer (*i.e.*, low, medium or high), as A, if "a" refers to a different layer.

a = form of *predominating cloud highest* in the scale of cloud forms when more than one type of cloud exists (*see* Code 2).

N = *total amount of sky covered with cloud* (scale 0 to 10).

h = height of base of lowest cloud present (*see* Code 9 New International Code above).

C = form of cloud to which ddF_1 refers (*see* Code 2).

dd = direction of motion of low cloud on the scale 01 to 36.

F_1 = approximate speed of low cloud (*see* Code 1).

S = the state of the sea (*see* Code 6).

The following is a specimen message :—

G.F.A.	Meteor.	1100	G.M.T.		
61	12644		91722		
62	11738		02023		
666	27200		01814		
755	15520		02034		
766					
61	4910	12215	22417	32520	42425
		52427	62330		

Forecast clouds below 500 feet inland. Slight rain probable. Cloud lifting and visibility improving on coast with freshening S.W. winds.

The last part of the message gives the result of a pilot balloon ascent as follows :—

Place : Croydon. *Time :* 1000 G.M.T.

Height (*feet*).	*Wind Direction* (*Degrees from North*).	*Wind Speed* (*m.p.h.*).
500	220	15
1,500	240	17
3,000	250	20
5,000	240	25
7,000	240	27
10,000	230	30

NOTE.—I. If any figures are missing a hyphen or dash is transmitted in place of each missing figure.

II. When the information regarding the direction and speed of low cloud at an *inland* station is not available at 0700, 1000, 1300 or 1600, the corresponding group is omitted from the message.

III. The specifications of the codes used are given in the pages following.

Time of Observation	Place.	General Weather.	Visibility.	CLOUD. Height of Lowest Cloud (feet).	CLOUD. Amount 0 = Nil; 10 = Overcast. Amount of Low Cloud.	CLOUD. Amount 0 = Nil; 10 = Overcast. Total Amount of Cloud	Wind at Surface (Speed in m.p.h.)	Weather in Preceding Two Hours.
1100	Croydon -	Cloud increasing	4,000 yds.	1,500	4	9	S. by W.5	Cloudy.
1100	Biggin Hill	Cloud, slight mist	4 miles	800	8	10	S.W.5 -	Mist.
1100	Lympne -	Fog - - -	200 yds.	Below 150	10	10	S.S.W.2 -	Thick fog.
1100	BeachyHd	Mist - -	2,000 yds.	450	10	10	S.W.10 -	Thick fog.
1100	Channel visibility from Hythe - -		4,000 yds.	--	--	--	—	—
1100	,,	Beachy Head	2,000 yds.	--	—	—	--	-
1100	,,	Dungeness -	4,000 yds.	—	—	--	—	—

Forecast : Clouds below 500 feet inland. Slight rain probable. Cloud lifting and visibility improving on coast with freshening S.W. winds.

CODE 1.

Approximate Speed of Low Cloud (F).

Code No.	Corresponding Mean Speed.		Limits of Speed.	
	Km. per hour.	Miles per hour.	Km. per hour.	Miles per hour.
0	Less than 5	Less than 3	0 to 7	0 to 4
1	15	9	8 ,, 22	5 ,, 14
2	30	19	23 ,, 37	15 ,, 23
3	45	28	38 ,, 52	24 ,, 32
4	60	38	53 ,, 67	33 ,, 42
5	75	47	68 ,, 82	43 ,, 51
6	90	56	83 ,, 97	52 ,, 61
7	105	66	98 ,, 112	62 ,, 70
8	120	75	113 ,, 127	71 ,, 79
9	135	85	128 ,, 142	80 ,, 89

CODE 2.

Form of Cloud (A.a.).

1 = Ci.
2 = Ci. St.
3 = Ci. Cu.
4 = A. Cu.
5 = A. St.
6 = St. Cu.
7 = Nb.
8 = Cu. (or Fr. Cu.).
9 = Cu. Nb.
0 = St.

In the case of stratus cloud of amount 10, when the corresponding figures in the cloud group would be 00, the figure for cloud height and the figures for present weather would prevent misunderstanding.

CODE 6.

Visibility (V or V_s).

Code No.	*Description.*
0 =	objects not visible at 50 metres (55 yards).
1 =	objects visible at 50 metres but not at 200 metres (220 yds.).
2 =	,, ,, 200 ,, ,, 500 ,, (550 ,,).
3 =	,, ,, 500 ,, ,, 1,000 ,, (1,100 ,,).
4 =	,, ,, 1,000 ,, ,, 2,000 ,, ($1\frac{1}{4}$ miles).
5 =	,, ,, 2,000 ,, ,, 4,000 ,, ($2\frac{1}{2}$,,).
6 =	,, ,, 4,000 ,, ,, 10,000 ,, ($6\frac{1}{4}$ miles).
7 =	,, ,, 10,000 ,, ,, 20,000 ,, ($12\frac{1}{2}$,,).
8 =	,, ,, 20,000 ,, ,, 50,000 ,, ($31\frac{1}{4}$,,).
9 =	,, ,, above 50,000 ,, ($31\frac{1}{4}$ miles).

CODE 7.

State of the Sea (S).

0 = no swell .... }
1 = moderate swell .... } Calm or slight sea.
2 = heavy swell .... }
3 = no swell .... }
4 = moderate swell .... } Moderate sea.
5 = heavy swell .... }
6 = rather rough sea.
7 = rough sea.
8 = very rough sea.
9 = mountainous sea.

General Forecasts.

Forecasts are issued daily by wireless as follows :—

General inferences based upon 7h. and 18h. observations are issued from the Air Ministry (GFA 1,400 m. C.W.) at 0915 and 2000. At 0930 and 2130 messages are issued from Poldhu (MPD 2,800 spark) giving a forecast of conditions over the western seaboard of the United Kingdom (plain language).

Gale Warnings.

Gale warnings are issued by W/T from the following stations on a wavelength of 600 m. whenever an atmospheric disturbance is approaching or developing which is likely to cause a gale (Beaufort Force 8) in the open sea within 150 miles of the issuing station :—

Malin Head	GMH	Seaforth	GLV
Valentia	GCK	Niton	GMI
Land's End	GLD	Wick	BYG
Fishguard	GRL	Cullercoats	GCC

Airship weather warnings are now issued by wireless telegraph direct from the Air Ministry instead of *via* the Admiralty.

GREECE

Meteorological and time signals are *proposed* as follows :—

(i) Communication of the weather bulletins issued by the Hydrographic Service.

(ii) Time signals according to observatory indications.

(iii) Navigational warnings to mariners and other important hydrographic matter requiring immediate transmission (dangers, etc), according to the Hydrographic Service indications.

Athens transmits a meteorological report at 0700 (G.M.T) on a wavelength of 1200 metres.

HAWAII

Weather bulletins obtained from the United States Weather Bureau at Honolulu are broadcasted daily by the Pearl Harbour Radio Station (NPM) at 8 a.m., noon, 4 p.m., and 8 p.m., and after time signal.

Time Signal.—U.S. Naval Radio Station, Pearl Harbour, T.H., transmits time signals daily on 600-metre damped, and 11,200-metre undamped, waves at noon, 180th meridian time—*i.e.*, at 2355-2400 (G.M.T.), accurate to within 0·2 second with San Francisco Naval Observatory time.

HOLLAND.

(*a*) Transmitting station—Scheveningen (call signal PCH). Wavelength, 1,800 m. spark. Times of sending, 1115 and 2315 G.M.T. (?)

The messages are preceded by the letters KNMI and consist of 7h. and 18h. observations respectively from—

Part I.—Helder, Flushing, Grisnez, La Hague (Code BBBDD FWTTu).

Part II.—Yarmouth, Tynemouth, Skudesnaes, Sylt (Code BBBDD FWTT).

When necessary, a storm signal is given (giving notice of shifting of storm) and also a notice to mariners preceded by letters NBAZ.

(*b*) Transmitting station—Soesterberg (call signal STB). Wavelength 1,680 m. C.W. (0905 and 1505 messages on 1,900 m. C.W.).

Times of sending	0745	(G.M.T.)	(observations at	0700	(G.M.T.))
,, ,, ,,	0905	,,			
,, ,, ,,	0945	,,	,, ,,	0900	,,
,, ,, ,,	1045	,,	,, ,,	1000	,,
,, ,, ,,	1145	,,	,, ,,	1100	,,
,, ,, ,,	1345	,,	,, ,,	1300	,,
,, ,, ,,	1505	,,			

Observations relate to the following stations :—

1 Helder, 2 Flushing, 3 De Bilt, 4 La Hague, 5 Schiphol, 6 Rotterdam.

NOTE.—For stations 1, 2, 3 and 4, the reports are sent in the new International Code for hourly reports, including barometer readings.

For station 4 no barometer reading is included.

For stations 5 and 6, the reports are sent in the new code for abbreviated reports recommended by the International Commission for Weather Telegraphy in September, 1921, *viz.:* wwVhL NDDFW.

The 0945 and 1145 reports contain information for Schiphol and Rotterdam only.

In the 0745 message, the result of a pilot balloon ascent at De Bilt is given in the New International Code, for heights up to 1,500 m. (velocities in km/hr.).

The 0905 and 1505 reports are " upper-air " reports and include upper-winds at De Bilt above 1500 m. and upper-air temperatures and humidities at Soesterberg. (Velocity in km/hr.; pressure in mm.).

The W/T station Soesterberg sends an aerological report* to Germany at 0915 and 1525 (Amsterdam time) combined with synoptic weather reports.

LONDON-AMSTERDAM AIR-ROUTE.
(Route weather Reports.)

Route weather reports for the Aerial route London-Amsterdam will be sent out by Soesterberg at 1005, 1105 and 1405 (Amsterdam time). These reports will be sent on a wavelength of 1,680 m. C.W. and will be issued in the International Code for route weather reports as used for route London-Paris, with an addition of a 5-figure group for direction and speed of the clouds.

Observations refer to Helder (1); Vlissingen (2); De Bilt (3); Scheveningen (4); (the number in brackets is the station number).

Code: Station number $DDFD_1F_1$ ALaNh $wwWVV_s$ BBBKc Cddvv.

NOTES.—The fourth group is missing for station (4).

At 1105 and 1405 Schiphol (5) and Rotterdam (6) will also send wwVhl NDDFW. At the end of the 0805 report a pilot balloon warning at De Bilt will be added in the code; pilot hddvv, where h = 1, 2, 3 or 4, and 1 = 200 m., 2 = 500 m., 3 = 1,000 m., and 4 = 1,500 m. At 1205, a report containing only Schiphol (5) and Rotterdam (6) will be issued (same as report at 1005).

At 1025 and 1625 a complete aerological report* will be issued, containing the results of the wind observation above 1,500 m., the temperatures and the amounts of humidity according to an observation by aeroplane at Soesterberg.

This report will be given in the International Code: Pilot hddvv (3 times) temp. p_1 p_1 T_1 T_1 H_1 p_2 p_2 T_2 T_2 H_2, etc. (9 times), where h = 1, 2 . . . . 9 (1 = 200 m., 2 = 500 m., 3 = 1,000 m., 4 = 1,500 m., 5 = 2,000 m., 6 = 3,000 m., 7 = 4,000 m., 8 = 5,000 m., 9 = 6,000 m.), while ppTTH gives the barometer, temperature and humidity, respectively at 200, 500, 1,000, 1,500, 2,000, 2,500, 3,000, 4,000, 5,000 m.

In the pilot balloon warnings the direction of the wind is given in ten degrees, the speed in km. per hour. In the groups after temp. pp means the barometer in mm. (first figure omitted) and TT means the temperature in whole degrees centigrade (50 added for temperatures less than 0).

The first four groups of " Temp. " are repeated in the route weather report of 1105, also those of " Pilot " when they have not yet been issued at 0805.

All times used are Amsterdam mean time.

* = " Upper-air " report.

HONG-KONG.

A summary of meteorological conditions and weather forecasts will be broadcasted (on a 600 metre wavelength from a 5 kw. spark set) by Cape d'Aguilar daily at 0500 (G.M.T.) and repeated at 0900 (G.M.T.) (1 p.m. and 5 p.m. Hong-Kong standard time).

Storm warnings are broadcasted at about 0400 (G.M.T.) and repeated every two hours until 1600 (G.M.T.). If a second warning is issued during the day the later warning will be substituted.

When within range of Cape d'Aguilar the captain will arrange for observations to be made at 0600 and 2200 (G.M.T.) and a message, prepared by the observer, will be handed to the operator for transmission containing the following information.:—

(*a*) Ship's name, position, and the time of observation (G.M.T.).

(*b*) Barometer reading (with no correction whatever, except in the case of ships which have not sent comparison observations to the observatory at Hong-Kong). Such ships should correct the readings of mercurial barometers for index error and reduce them to 32° F., sea level, and gravity at 45° latitude, using the best index-error available and adding the word "corrected."

(*c*) Thermometer reading (if the barometer is of the mercurial type).

(*d*) Wind direction and force.

(*e*) State of weather (in plain language).

Under no circumstances will the operator write these messages.

Reports for transmission from the ship will be addressed to "Royal Observatory, Hong-Kong," and immediately on the acceptance of these messages the operator will enter (*a*) Prefix "S," (*b*) Date, (*c*) Time handed in (G.M.T.).

All messages handed in under the above conditions shall be dealt with as follows :—

They shall be communicated to the coast station at the first opportunity, and shall receive priority as Government messages.

Wherever possible, each message shall be repeated.

All messages shall be treated free of coast tax, ship tax, and land charges.

Reports handed in for transmission written on any form other than on the message form numbered SI, shall be affixed to a message form SI in such a manner as not to cover the space reserved for service instructions and other data.

TIME SIGNALS.

The Hong-Kong Observatory also sends wireless Time Signals *via* Stonecutters at the even seconds between 0156 and 0200 (G.M.T)., and between 1256 and 1300 (G.M.T). The 2nd, 28th, 50th, 52nd and 54th seconds are omitted for the purpose of identifying the signals.

The Time signals are preceded by the following warning signals from Stonecutters between 0154 and 1155 (G.M.T). and between 1254 and 1255 (G.M.T.).

CQ DE BXY HK TIME WAIT

Both warning and time signals are sent out on a wavelength of 2,000 metres from a 30 kw spark set. The time signals are dots of about 0.2 second duration. Radiotelegraphic land and ship stations within range of Stonecutters are required to keep silent between 0154 and 0200 (G.M.T.) and between 1254 and 1300 (G.M.T.) in accordance with Article 45, paragraph 3 of the Service Regulations appended to the International Radiotelegraph Convention of 1912. Operators are also required to keep themselves provided with the most accurate time available in order to know when to shut down.

The Director of the Royal Observatory at Hong-Kong requests that every master possessing a W/T installation will send observations at the times stated and thus increase the accuracy and utility of the observatory forecasts.

HUNGARY.

Transmitting station—Csepel (near Budapest). Call signal, HB. Wavelength. 3,000 m. spark. Time of sending, 0920 (G.M.T.) (observations at 7h. local time).

The message begins with Metro Hongroise and observations relate to the following stations:—

01	Bupapest	19° 2′ E.	47° 30′ N.
02	Szombathely	16° 36′ E.	47° 16′ N.
03	Kaposvar	17° 48′ E.	46° 22′ N.
04	Szeged	20° 09′ E.	46° 15′ N.
05	Debreczen	21° 38′ E.	47° 31′ N.

Code: station number BBBDD FWTTC βbbRR MMmm.

At 1030 G.M.T. a weather bulletin is issued by the Institute of Meteorology and Magnetism, Budapest.

INDIA.

TIME SIGNALS.

Time Signals based on the International system are sent out from Calcutta Radio Station (VWC) twice daily, at 0127-0130 and 1327-1330 (G.M.T.). The wavelength used is 2,000 metres and the power 30 kw. The signals are controlled from the Alipore Observatory at Calcutta.

Should the time signals be inaccurate for any reason, they will be followed by the "erase" signal of nine or more dots and the words "Signal failed."

Arrangements are being made for similar signals to be sent out at 0057–0100 and 1257–1300 (G.M.T.) from Bombay Radio Station (VWB). These signals will be controlled from Colaba Observatory, Bombay.

WEATHER REPORTS.

The Meteorological Department supplies each day to the radio stations concerned, messages to be signalled broadcast at the following times and on the specified wavelengths:—

Station.	*Call-sign.*	*Wavelength metres.*	*Time (G.M.T.).*
Bombay	VWB	2,000	0100 and 1300
Madras	VWM	2,000	
Rangoon	VTR	1,200	
Karachi	VWK	2,000	0130 and 1330
Calcutta	VWC	2,000	
Port Blair	VTP	1,200	

Arrangements have been made under which certain large ships when in the Arabian Sea or the Bay of Bengal send daily weather messages to the Indian Meteorological Department. These messages contain information of the ship's position, barometer reading, wind force and direction, state of sea and cloud.

Copies of the Code used for these telegrams have been distributed to several shipping agents in India, and are also obtainable from the Indian Meteorological Department.

The report sent out from Bombay and Karachi gives the weather conditions in the East Arabian Sea, while that broadcasted from the other four stations refers to the Bay of Bengal.

ITALY

AEROLOGICAL AND METEOROLOGICAL SERVICE.

I. At present the service is carried out by three groups of stations, the central station of the first group being at Rome, that of the second group at Florence, and that of the third at Naples.

II. Transmissions are made twice a day at the hours given in the table below, in which the length of wave used is also given :—

Groups.	*Stations.*	*Times.*		*Wave-lengths.*
I. Central Station,				
Rome ..	**Genoa†** ..	0730 to 0735	1330 to 1335	600 s.
	Leghorn ..	0735 ,, 0740	1335 ,, 1340	1,200
	Ancona ..	0755 ,, 0800	1355 ,, 1400	1,200
II. Central Station,				
Florence ..	**Padua** ..	0740 ,, 0745	1340 ,, 1345	900
	Turin ..	0745 ,, 0750	1345 ,, 1350	900
	Milan ..	0750 ,, 0755	1350 ,, 1355	900
III. Central Station,				
Naples ..	**Vittoria†** ..	0725 ,, 0730	1325 ,, 1330	600
	Maddalena ..	0730 ,, 0735	1330 ,, 1335	600
	Messina ..	0735 ,, 0740	1335 ,, 1340	600
	Brindisi ..	0740 ,, 0745	1340 ,, 1345	2,500 arc.

III. The Florence and Naples stations transmit a summary of the reports received to Rome (ICD) at the following times, and with the following wavelengths :—

Stations.	*Times.*		*Wavelength.*
Naples	0800 to 0810	1400 to 1410	3,200 arc.
Florence	0810 ,, 0820	1410 ,, 1420	900 s.

IV. The complete reports are then transmitted from Rome (IDO) at 0930 (observations at 7h.) and 2045 (observations at 18h.) with wavelength 11,000 m. C.W. At 0345 Rome (IDO) transmits a local weather report to Paris.

The same synoptic report is issued simultaneously from Centocelie (call signal ICD) with wavelength 2,250 m. spark.

V. Observations relate to the following stations marked thus (*). The other stations will commence operations as soon as ready :—

* 01	Turin.	* 08	Leghorn.	15	Cagliari.
* 02	Milan.	* 09	Ancona.	* 16	Messina.
03	Trent.	10	Chiete.	17	Palermo.
* 04	Padua.	* 11	Rome.	* 18	Vittoria.
05	Trieste.	* 12	Maddalena.	* 19	Taranto.
* 06	Genoa.	* 13	Naples.	* 20	Venice.

† Genoa passes the reports to Leghorn and Vittoria to Messina for transmission to Centocelie.

VI. Codes used :—

A.—Observations at 7h.

There are four groups of five figures each, giving observations at 7h., followed by two groups of six figures giving upper air data.

Code.—Station number (two figures) BBBDD FWTTC βbbRR MMmmu $V_1D_1V_2D_2V_3D_3$ $V_4D_4V_5D_5V_6D_6$

Where first four groups are in the old International Code and $V_1D_1V_2D_2$, etc., give velocity and direction of the wind in m/s at altitudes of 500, 1,000, 1,500, 2,000, 3,000 and 4,000 m. above sea-level.

D = direction.

0 = no wind.		5 = wind from	S.
1 = wind from	N.	6 = ,,	S.W.
2 = ,,	N.E.	7 = ,,	W.
3 = ,,	E.	8 = ,,	N.W.
4 = ,,	S.E.		

V = velocity.

0 from 0 to 1 m/s.	5 from 9 to 11 m/s.
1 ,, 1 ,, 3 ,,	6 ,, 11 ,, 13 ,,
2 ,, 3 ,, 5 ,,	7 ,, 13 ,, 15 ,,
3 ,, 5 ,, 7 ,,	8 ,, 15 ,, 17 ,,
4 ,, 7 ,, 9 ,,	9 above 17.

B—Observations at 18h.

Code: Station number (two figures). BBBDD FWTTC $V_1D_1V_2D_2V_3D_3$ $V_4D_4V_5D_5V_6D_6$ (where groups have same meaning as at 7h.).

Notes.—Should any data be missing from a group, an equal number of x's are inserted in its place. Should soundings not be taken, the message concerning one station will consist of only two groups (meteorological); and when the sounding does not reach 2,000 m. the message will consist of three groups (two meteorological and one aerological).

The "Saseno" IDB wireless telegraph station transmits aerological and meteorological reports at 0700 and 1700 to the ship at Brindisi IDV, with a 600 s. wave.

The wireless telegraph station at St. Elmo (Naples) also carries out the following special service for the exchange of reports on local weather conditions, and on the departure and arrival of aircraft for the Rome to Naples and Naples to Rome service.

St. Elmo W/T station, wave 3,200 c.	0700 to 0745	Exchange of meteorological information and reports of movements of aircraft.
Centocelie ,, ,, 3,850 c.		
St. Elmo ,, .. at	0915, 1100	Bulletin.

JAPAN

The storm warnings issued by the Central Meteorological Observatory at Tokyo are transmitted free of charge to vessels at sea from the wireless telegraph stations at Choshi, Fukkikaku and Dairenwan, according to the following method (it always being understood that this shall not apply in the case of special transmissions made at the request of vessels):

The storm warnings will be issued in the English language, and will comprise the items referred to in (*a*) and (*b*) below:

(*a*) Text of warning, date, time; position, rate and direction of movement of centre of atmospheric depression or typhoon.*

(*b*) Maritime instructions and notices. When storm warnings are received at the coastal stations, they will be immediately transmitted, and

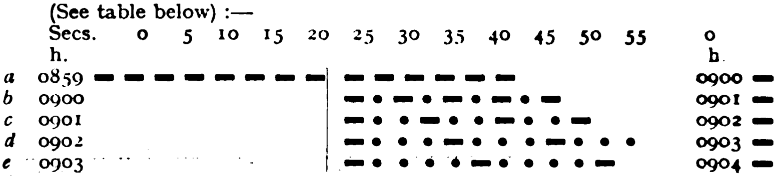
* A typhoon is an extremely violent storm, travelling slowly, and from 50 to 100 miles in diameter.

will be repeated from the Choshi station at 9.5 p.m., from the Fukkikaku station at 8.30 p.m., and from the Dairenwan station at 9 p.m.

Wavelengths of 600 metres are employed, and the storm warnings are continued three times after the signal "QST" has been thrice repeated.

NOTIFICATION OF THE DEPARTMENT OF COMMUNICATIONS NO. 1,105.

From December 11th, 1916, the following procedure for announcing central standard time at 1200-1204 (G.M.T.) by wireless telegraphy was adopted at the Choshi and Funabashi wireless telegraph stations :—



Procedure for Time Signalling by Wireless Telegraphy.

1. Every evening, with the exception of Sundays, Time Signals are automatically made by the transmitting apparatus at the Choshi and Funabashi wireless telegraph stations, as communicated by the Tokyo Observatory through the connected telegraph wires on land. The wavelength of 600 metres is used in the case of the Choshi station and that of 4,000 metres in the case of the Funabashi station.

The time to be signalled in accordance with the above is indicated five times—*viz.*, at 9.0 p.m. (Central Japan Standard Time), 9.01, 9.02, 9.03, and 9.04 (1200-1204 G.M.T.) by means of dashes continuing for one second from the times mentioned, and following the various warning signals distinguished as below :—

(*a*) The first warning signal, consisting of dashes, will commence at 8.59 p.m., and continue till 8.59.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(See table below) :—

(*b*) The second warning signal, consisting of a long dash and a dot, will commence at 0900.30 and continue till 0900.55, after which a suspension of five seconds will be followed by a dash continuing for one second.

(*c*) The third warning signal, consisting of a dash and two dots, will commence at 0901.30 and continue till 0901.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(*d*) The fourth warning signal, consisting of a dash and three dots, will commence at 0902.30, and continue till 0902.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

(*e*) The fifth warning signal, consisting of a dash and four dots, will commence at 0903.30, and continue till 0903.55, after which a suspension of five seconds will be followed by a dash, continuing for one second.

MALTA

A meteorological message is issued daily at 0900 and 2100 (G.M.T.) by Rinella (BYZ) Wireless Telegraph Station ; wavelength 4,200 C.W.

MAURITIUS

Time Signals are radiated daily by the Mauritius Wireless Station at 9 a.m. and p.m. (G.M.T.) to 9.1 a.m. and p.m. on a wavelength of 2,000 metres spark, but the times are stated to be not perfectly accurate. The procedure adopted is :—N's made by hand every ten seconds, commencing at 0859 and concluding with a dash at 0900. G's made by hand every ten seconds, commencing at ten seconds past 0900, concluding with a dash operated

from Observatory at 0901. During the past year wireless information concerning cyclonic disturbances have been issued to ships within range as cyclones occurred.

MEXICO

A service of hourly signals has been established, and these are transmitted in the following manner :—Every day at 1155 (Tacubaya D.F. time, 6h. 36m. 46.67secs. behind Greenwich) the wireless station at Chapultepec, with a transmitter of 20 kw. and a wavelength of 2,000 metres, gives the general call; at 1156 it gives the call of its own station (XDA); at 1157 it makes a telegraphic dot every second until 1157.29 seconds; a silence of a second and more dots until 1157.55 seconds; a silence of 5 seconds; it then again makes dots from 1158 to 1158.29 seconds and from 1158.31 seconds to 1158.55 seconds; dots from 1159 to 1159.29 seconds and from 1159.31 seconds to 1159.50 seconds; a silence of 10 seconds and at 1200, exactly, a dash lasting a second.

At 1816.13 seconds (Tacabuya time) the same wireless station of Chapultepec with its 200 kw. transmitter and a wavelength of 5,500 metres, gives the general call; at 1817.13 seconds it gives the call of its own station (XDA); at 1818.13 seconds it makes telegraphic dots every second until 1819.8 seconds, then a silence of 5 seconds and it begins to make telegraphic dots again at 1819.13 seconds, and thus successively until 1823.8 seconds, when, after a silence of 5 seconds, it gives a dash lasting one second 1823.13 seconds, which coincides with 0100 Greenwich time.

The coastal wireless stations of Campeche, Guaymas, Mazatlan de Sinaloa, Payo Obispo and Vera Cruz send out weather reports daily at 9 a.m. (? local time), each word being repeated twice. If a dangerous change for shipping appears likely advice is sent out in the same form at any hour of the day or night.

A service of "Shipping Advice" has also been established, and this is transmitted by the same coast stations whenever it seems advisable at 12 noon (? local time), and for three consecutive days in cases of change of lighthouse lights, subsidence of the coasts and any dangers which concern navigation.

MOROCCO.

For the purpose of publishing meteorological and aviation intelligence it has now been arranged that certain stations, civil and military and naval, transmit at certain definite times, three times per diem, meteorological information for the use of aviation and scientific purposes.

The transmitting posts and hours are as follows :—

Tangier transmits at	0700	1300	1800
Casablanca transmits at	0705	1305	1805
Mequiney transmits at....	0710	1310	1810
Middelt (Assaka) transmits at....	0720	1320	1820
Bow Denie transmits at.... ...	0730	1330	1830
Agadir transmits at	0745	1345	1845

These readings are picked up by the following posts and transmitted to their respective sub-divisional aviation centres :—

Rabat (Control), Marrakesh (Morocco), Tadla, Fez and Taza.

Rabat (Control) also passes the information to the Headquarters of the Service Météorologique du Maroc, which is at present established at the aviation ground at Rabat.

As all commercial aeroplanes (at present only Latécoère Line) land at the aviation ground at Rabat from Toulouse, Barcelona, Alicante, Malaga, they are in possession there of the last meteorological readings for the whole of the French Morocco.

For the transmission of the meteorological and aviation news from Morocco to the world generally, the post of Sidi Abdallah, Tunis, takes in the readings of the wireless posts above mentioned, with those for the rest of Northern Africa, and transmits them in due course.

For the protection of aerial lines of flight, planes flying early in the day during the summer months, the following posts in French Morocco transmit their information meteorological news at an earlier hour than as above stated, April 1st to October 1st.

Meknes (Mequiney)	at 0530.
Casablanca	at 0535.
Middelt (Assaka)	at 0540.
Tangier	at 0545.
Bow Denib	at 0550.

Transmitting station: Mediouna (call signal: CNM).
Wavelength: 5,000 m. C.W.

Times of sending	0845	(G.M.T.)	(observations at 0700 G.M.T.).
,, ,,	1430	(G.M.T.)	(observations at 1300 G.M.T.).
,, ,,	1945	(G.M.T.)	(observations at 1800 G.M.T.).

The messages begin with the words "Meteo Rabat" and contain observations relating to the following stations:—

01 Tangier.	09 Mequinez.
03 Rabat.	12 Taza.
04 Casablanca.	15 Bu-denib.
07 Agadir.	

08·45 *Message.*

Code: Station number (two figures) BBBDD FWTT βbbu. The message may also contain upper winds at three stations in the same code as those included in the Eiffel Tower reports (page 1150).

14·30 *and* 19·45 *Messages.*

Code: Station number (two figures) BBBDD FWTT βbb.

NETHERLANDS

Since July 1st, 1915, the station of Scheveningen Harbour has been sending at 11.15 and 23.15 (Greenwich time) on a wavelength of 1,800 metres a meteorological radiotelegram in Dutch and English, followed by a storm signal whenever necessary and also a notice to mariners in Dutch and English.

The meteorological radiotelegram is preceded by the letters KNMI, and consists of four sets of two groups of five figures each for the stations Helder, Flushing, Gris Nez, and The Hague; and, further, of four sets of two groups wherein one group has five and the other group four figures each for the stations Yarmouth, Shields, Skudnaes and Sylt, according to the scheme.

BBBDD FWTT(S).

The letter x is used to denote missing figures.

Following the above comes, if deemed important, first, the storm signal—*e.g.*, warning signal, signal of shifting south-east storm; second, the notice to mariners, preceded by the letters NBAZ—*e.g.*, wreck, mouth Hock of Holland.

Examples of meteorological radiotelegrams from the first and the fifth of the eight sets of two groups KMNI are 69010-21541 and 57316-4405; their translations follow:—

HELDER.	YARMOUTH.
Barometer, 769·0 mm.	Barometer, 757·3 mm.
Wind direction, E.S.E.	Wind direction, south.
Wind force, very light.	Wind force, moderate.
Sky, slightly cloudy.	Sky, overcast.
Temperature, 4° C.	Temperature, 5° C.
Sea, very smooth.	

Meteorological reports are also issued from Soesterberg at 0820, 1020 and 1420 (G.M.T.) since May, 1920, giving information for Helder (01), Flushing (02) and De Bilt (03) in the code BBBDD FWTTV.

NEW ZEALAND

(See Australasia.)

NORWAY

The meteorological wireless station at Quade Hook, is owned by the Norwegian Meteorological Institute. Storm warnings are sent from most of the wireless stations.

Transmitting station: Christiania Radio (call signal LCH).
Wavelength: 8,000m. C.W., position 59° 59′ N; 10° 41′ E.
Normal range: 1,100 km.

Times of sending: 0845 (G.M.T.) (observations at 7h. G.M.T.).
,, ,, 1550 (G.M.T.) (observations at 13h. G.M.T.).
,, ,, 2010 (G.M.T.) (observations at 18h. G.M.T.).

Observations relate to the following stations:—

Station No.	Station.	Position.	
		Latitude.	Longitude.
05	Green Harbour (S)....	78° 2′	14° 14′
10	Ingoy (S)	71° 4′	24° 9′
12	Tromso (S)	69° 39′	18° 58′
20	Aalesund (S)	62° 28′	6° 10′
22	Valdersund (S)	63° 52′	9° 45′
30	Okso (S)	58° 4′	8° 4′
32	Lister (S)	58° 6′	6° 34′
35	Bjornoya (S)	74° 28′	19° 17′
40	Andenes (S)....	69° 20′	16° 8′
42	Rost (S)	67° 30′	12° 4′
50	Bergen (S)	60° 24′	5° 19′
53	Faerder (S)	59° 2′	10° 32′
60	Vardo (S)	70° 22′	31° 8′
70	Bronnoy (S)....	65° 28′	12° 13′
80	Utsire (S)	59° 18′	4° 53′
82	Skudenes (S)	59° 9′	5° 16′
90	Dombaas	62° 5′	9° 7′
91	Trondhjem	63° 26′	10° 25′
97	Bergen	60° 24′	5° 19′
98	Tromso	69° 39′	18° 58′
99	AAs	59° 40′	10° 46′

Observations are given in the code recommended by the Commission for Weather Telegraphy, London, November, 1920.

Observations for coastal stations (marked " S ") are sent in the following code :—

At 7h. and 18h. BBBDD FwwTT cbWVH ALaNh RRSV r
At 13h. BBBDD FwwTT cbWVH ALaNh

For stations 12 (Tromso) and 50 (Bergen) an additional cloud group in the form C_1ddVV is given, when possible.

Observations for 90 (Dombaas Land Station) are given in the code :—

7h. BBBDD FwwTT cbWVH ALaNh RRmmr C_1ddVV
13h. ,, ,, ,, ,, C_1ddVV
18h. ,, ,, ,, ,, RR – – r C_1ddVV

For station 91 (Trondhjem) a nephoscope* group only is sent in the form C_1ddVV.

At the end of the 7h. and 18h. messages are given the results of pilot balloon ascents in the code $h_1$ddvv for (VV = Km–hour).

97 Bergen 99 AAs
98 Tromso

Observations for the following stations are sent only when data from other stations are not available at the time of issue :—

12 Tromso 32 Lister 82 Skudesnaes
22 Valdesund 42 Rost

NOTE.—Barometer readings are given in millibars, and barometric tendency in half millibars.

PANAMA

(See United States.)

PERU.

It is proposed to initiate a time signal service at Lima Station as soon as circumstances permit, but no arrangements have as yet been made for the transmission of weather, meteorological or hydrographic signals.

PHILIPPINE ISLANDS

Time Signals are transmitted from Manilla to every Telegraph Station all over the country by land lines every day at 1100 a.m. (0300 G.M.T.). The clock of the Central Observatory, which is connected with the Bureau of Posts telegraph office at Manilla by a land line, is connected to the telegraph circuit at 10.55 a.m. Time signals are then sounded. In the last half minute before 11.00 a.m. the operator at the central office dots with the key during 20 seconds to indicate that it is the last half minute. Ten seconds are omitted in order to give a chance to adjust instruments to receive the final corrected time. Then, at the expiration of the 10 seconds, a long heavy dash is given, thus completing the time and correcting the clocks in all offices. The Cavite Naval Radio Station co-operating with the Bureau of Posts and the Manilla Observatory sends time signals of the 120th meridian East of Greenwich, at 1100 and 2200 every day, Sundays and holidays inclusive. Manilla Observatory time signals begin at 1055 and 2155, standard time of the 120th meridian East of Greenwich, and continue for five minutes. During this interval every tick of the clock is transmitted except the 28th, 29th, 54th, 55th, 56th, 57th, 58th and 59th of each minute. Thus far the radio transmission has been by a 5 kw. spark set on a wavelength of 952 metres; the time signals are broadcasted now on both arc and spark transmitter simultaneously, using 952 metres on the spark and 5,000 metres on the arc

* A nephoscope is an instrument for accurately measuring the motions of clouds.

transmitter. Weather warnings are sent immediately following the time signal, and are of the same wavelength as the time.

The Naval radio station is connected with Manilla by land line.

Weather reports are exchanged regularly between the observatory at Manilla and that of Guam, *via* the Naval radio station at Cavite. Weather warnings are also sent to Hanoi, French Indo-China, *via* Cavite.

In the near future weather warnings will also be broadcasted from the station at Batangas.

POLAND

Transmitting Station: Warsaw (call signal: WAR).
Wavelength: 2,000 m. spark.

Times of sending: 0755 G.M.T. (observations at 7h. local mean time).
,, ,, 1530 G.M.T. (observations at 13h. local mean time).
,, ,, 2020 G.M.T. (observations at 19h. local mean time).
Each message begins with the words "Meteo Pologne."

The message is composed of two parts; the first part contains ordinary observations, the second wind-sounding.
Observations relate to the following stations:—
01 Posen, 02 Warsaw, 03 Bialystok, 04 Lodz, 05 Lublin, 06 Cracow, 08 Lemberg, 10 Bremberg, 11 Zakepane.

Observations at 7h.

Part i (ordinary observations).
Code: Station number (two figures) BBBDD FWTTC βbbRR MMmm.
Part ii (wind-soundings).
Code: Station number (two figures) $D_1D_1V_1V_1D_2$ $D_2V_2V_2D_3D_3$, etc. (as Eiffel Tower code, which *q.v.*).

Observations at 13h. and 19h.

Part i (ordinary observations).
Code: Station number (two figures) BBBDD FWTT βbb.
Part ii (wind-soundings) 13*h. report only*, in code as for 7h. observations.

PORTUGAL.

Transmitting Station: Lisbon PQL.
Wavelength: 1000 m.
Times of sending weather messages: 0800, 2000 G.M.T.

PORTUGUESE EAST AFRICA

Time signals are sent out twice daily from Lourenço Marques at 7.57 to 8 a.m., and 6.57 to 7 p.m. (G.M.T.), on a wavelength of 600 metres following the system of the Eiffel Tower Ordinary 10 a.m. Time Signal, *q.v.*

Following every time signal, a local weather report is transmitted in English as follows:—

> CRZ Weather Report—at 8 a.m. G.M.T. (or 7 p.m. G.M.T.). Pressure at sea level 760.5 millimetres, wind E.N.E. strong, sea rough. Campos Rodrigues Observatory, Lourenço Marques.

PUERTO RICO

The San Juan Station is used for collecting meteorological data from the adjacent American Islands of the West Indies and from Cuba, and this information is, in turn, transmitted to the United States *via* the high power station at El Cayey, Puerto Rico.

ROUMANIA

Transmitting station: Heresbau (call signal: BUC).
Wavelength: 7,500 m. arc.

Times of sending 0400 (G.M.T.) (observations at 1800 and 0100 (G.M.T.).
„ „ 0750 (G.M.T.) (observations at 0700 G.M.T.).
„ „ 1350 (G.M.T.) (observations at 1300 G.M.T.).
The observations refer to Bucharest.
Code: Similar to British

SAMOA

Local weather bulletins, preceded by the letter T are broadcasted by the Tutuila Naval Radio Station (NPU) at 8 a.m., noon, 4 p.m., and 8 p.m.

SANTO DOMINGO

(Dominican Republic, West Indies.)

The aviation service (U.S.M.C.), situated a few miles from Santo Domingo, makes observations twice a day on the state of the weather, one in the morning and one in the evening. These observations are immediately reported by telephone to the Radio telegraphic station at Santo Domingo, which transmits them to the Observatory in Washington (*via* San Juan, Puerto Rico), as urgent messages.

Warnings of storms and hurricanes are circulated as soon as they are received, and uniformly every four hours afterwards, except at 0400. These warnings are also telephoned to the Signal Tower, " Fuerte Ozama," where these signals are sent out. This Signal Tower dominates the whole bay south of Santo Domingo.

During the summer months, especially between 1900 and 0500, a strong statical action is experienced. During the winter months, from the latter part of September until May, very good conditions prevail, and stations which are not able to hear during the summer months can hear very clearly then.

SERBIA.

Transmitting station: Belgrade (call signal: HFB).
Wavelength: 4599 m. damped.
Times of sending 0740 (G.M.T.) (observations at 18h. and 7h. local time).
„ „ 1445 (G.M.T.) (observations at 14h. local time).

Messages commence with the words " Meteor Belgrade."
Code: Old International Code.

SOUTH AFRICA

The present arrangements for meteorological reports are as follows:—

	Station.	Times G.M.T.	
VNC	Capetown (Slangkop)	1315	Daily (except Sundays) a CQ message forecasting weather conditions along the coast.
	Port Elizabeth	1330	
VND	Durban	1300	

Durban also sends out daily (except Sundays) at 1330, a message stating the *local* weather conditions and barometer and thermometer readings taken at 0800.

The arrangements made in the Union of South Africa for the transmission of radio time signals for the use of shipping in South African waters is as follows:—

A special clock at the Royal Observatory, Capetown, is adapted to give automatically a series of signals of a distinctive character extending over an interval of half a minute. The clock is brought into conformity daily with

the observatory standards shortly before the hour selected for transmitting the signals. The hour chosen is 11 p.m., Union standard time (9 p.m. G.M.T.).

The time signal is preceded by the usual warning signal from the Slangkop Radio Station. The time signal proper consists of twelve dashes, each of about ¾ of a second in duration, in five groups, commencing at the following Greenwich mean times :—

Group I.			*Group II.*			*Group III.*			*Group IV.*			*Group V.*		
h.	m.	s.	h.	m.	s.	h.	m.	s.	h.	m.	s.	h.	m.	s.
8	59	30	8	59	38	8	59	44	8	59	48	8	59	54
—	—	32	—	—	40	—	—	—	—	—	50	—	—	56
—	—	34	—	—	—	—	—	—	—	—	—	—	—	58
												9	0	0

The beginning of the last dash corresponding exactly with 9 p.m. Greenwich or 11 p.m. South African standard time.

SPAIN

The military radiotelegraph station of Carabanchel will transmit from March 1st, 1920, three radiotelegrams at the hours of 1000, 1530 and 2030 (G.M.T.) (observations at 7h, 13h. and 18h. respectively).

Wavelength, 2,000 metres.
Power, maximum.

All the radiotelegrams will commence with the initials of the Carabanchel wireless station, EGC, followed by SME, the initials of the words, "Servicio Meteorológico Espanol."

Radiotelegram at 1000 h.

This will contain the results of the meteorological observations at the stations given below, preceding the groups of signs corresponding to each one of the initials of the name of such station as indicated hereunder :—

1. MD, Madrid; 2, LC, La Coruña; 3, SF, San Fernando; 4, BA, Barcelona; 5, SA, Santander; 6, VD, Valladolid; 7, ZA, Zaragoza; 8, MA, Mahón; 9, BD, Badajoz; 10, CD, Córdoba; 11, AI, Alicante; 12, AL, Almeria; 13, ME, Melilla; 14, TE, Tetuán; 15, IZ, Izaña (Teneriffe). The observations of the stations 1–3 inclusive will be made at 7h. The others will be at 8h. (G.M.T.).

For each station the results of the observation made close to the ground are expressed by means of the four groups recommended by the Paris Conference * :—

BBBDD. FwwTT. βbbRR. 4. { NNN¹N¹u (coast station). NNN¹N¹h (interior station).

See the instructions for the telegraph service published by the Central Meteorological Observatory.

If the station makes upper-air soundings, the four groups mentioned above are followed by the five :—

$D_1D_1V_1V_1$ $D_2D_2V_2V_2$ $D_3D_3V_3V_3$ $D_4D_4V_4V_4$

The first group indicates the direction and velocity of the wind in metres per second according to the atmospheric conditions 250 metres above the meteorological station, the second group at 500, the third at 1,000, the fourth at 2,000, and the fifth at 3,000.

*ww = present weather; w'w' = past weather.
NN = form and direction of motion of low cloud.
N'N' = form and direction of motion of high cloud.

RADIOTELEGRAM AT 1530 H.

This will contain the observations made at 13h. (G.M.T.) at the same stations mentioned for the previous radiotelegram, and drawn up in the same manner.

Next appears a group of nine figures which express the state of the sea on our coasts, in conformity with the following rule: the first sign from the left indicates the state of the sea on that part of the coast comprised between San Sebastián and Santander; the second between Santander and Cape Estaca de Vares; the third between Cape Estaca de Vares and the Portuguese frontier; the fourth between Huelva and Gibraltar; the fifth between Gibraltar and Almería; the sixth between Almería and Valencia; the seventh between Valencia and the French frontier; the eighth in the Balearic Isles; and the ninth in Argelia.

This is followed by a group of eleven figures, indicating the probable weather for the following twenty-four hours: the first sign from the left indicates the probable weather in the regions of Galicia, Asturias and León, giving preference to that concerning the coast; the second corresponds to the provinces of Santander, Vizcaya and Guipúzcoa, likewise giving preference to the phenomena most interesting to navigators; the third, the weather which will be experienced in the central part of Spain, the provinces of Burgos, Palencia, Navarra, Logroño, Valladolid, Soria, Zaragoza, Zamora, Segovia, Guadalajara, Salamanca, Avila, Madrid, Teruel, Cáceres, Toledo, Cuenca, Badajoz, Ciudad Real, and Albacete, giving preference to the kinds of weather interesting to agriculturists; the fourth, the probable weather in the north-eastern part of Spain, provinces of Huesca, Lérida, Gerona, Barcelona and Tarragona, in its part which most interests farmers and navigators; the fifth, the weather in Levante: provinces of Castellón, Valencia, Alicante, and Murcia, in the part which interests farmers and navigators; the sixth, the weather in Andalusia: provinces of Córdoba, Sevilla, Huelva, Cádiz, Málaga, Jaén, Granada and Almería, giving preference to the weather interesting agriculturists; the seventh, the weather in the Straits of Gibraltar and north part of Morocco, giving preference to weather interesting navigation; the eighth, the weather in the Balearic Isles and in the adjacent zone in the Mediterranean, giving preference to weather interesting navigation; the ninth, in the English Channel and Northern Cantábrico; the tenth corresponds to the part of the Atlantic near to Portugal; and the eleventh to the Canaries. Naturally, the limits of these zones cannot be perfectly defined, and it therefore remains for those who may make use of these services to discriminate, according to circumstances, whether the prognostication of one or other of the immediate regions is to be taken into account.

When, owing to lack of telegrams or other circumstances, the weather cannot be predicted as regards a specific district, the letter X will be substituted for the corresponding sign.

When it is required to signal the position of a cyclonic centre or line of squall (Grain) dangerous to navigation or aviation, the word " precaución " will be transmitted, and afterwards groups of six figures, which, if they refer to cyclonic centres, will commence with CI, and be followed by the group llLLBB, in which the first two, ll, will indicate the latitude of the centre expressed in complete degrees; the third and fourth, LL, the geographical longitude also of the said centre to the east or to the west of the Meridian of Greenwich, expressed in complete degrees, those of the west, 01, 02, 03, etc., and those of the east by 51, 52, 53, etc.; the fifth and sixth signs, BB, will give the number representing the atmospheric pressure in millibars, omitting the hundreds. If it is a line of squall, it will be given in groups of eight signs, preceded by GR, and followed by IILLBBDD, the first four, IILL, indicating the position of the point of the line at which the barometer is the lowest; the fifth and sixth, the atmospheric pressure at this point in millibars, and without hundreds; and the last two, DD, the direction of the line of squall at 1300 G.M.T.

When a regular service of storm signals is established at ports, there will be indicated by a group of ten figures those signals which it is necessary to establish at different parts of our coasts. The successive signs will correspond to the parts of the coast as indicated below: 1, Cantabrian Coasts from Cape Higuer to Cape Mayor; 2, from Cape Mayor to Cape Estaca de Vares; 3, Galician Coast from Cape Estaca de Vares to the Portuguese frontier; 4, from Cape Creus to Cape San Antonio; 5, Balearic Islands; 6, from Cape San Antonio to Cape Gata; 7, Cape Gata to the Straits of Gibraltar; 8, Straits of Gibraltar to the Portuguese frontier; 9, East Coast of Africa (Tánger-Arcila); 10, Canaries.

RADIOTELEGRAM OF 2030 H.

Code: BBBDD FwwTT βbbRR NNN¹N¹u (or NNN¹N¹h).

GENERAL REMARKS APPERTAINING TO RADIOTELEGRAMS.

When the results of a meteorological station do not arrive at Carabanchel in time for transmission, the initial of the name of such station will be placed at the corresponding place in the radiotelegram with the words "no llegó" (not arrived).

In all messages, missing figures and groups are indicated by x's, and if complete sets of observations are missing the station letter is followed by "falta."

Regarding stations shown in the radiotelegrams which are situated on the coast, only particulars of the state of the sea can be given with precision for San Fernando, La Coruna and Mahón; therefore for the others the fifth figure of its fourth group will express the state of visibility of the horizon.

METEOROLOGICAL RADIO-TELEGRAMS FROM THE SEA.

Spain has adopted the code for the wording of meteorological radiograms *from the sea* in accordance with the agreements of the International Commission of Meteorological Telegraphy held in London, November, 1920.

The following resumé of the code is given:—

Two types of ciphers have been adopted for the wording of meteorological radiograms for transmission from navigating boats, the *first* for boats not able to devote much attention to this work, not having the necessary available material or staff for making the observations, and the *second* for those able to give more attention to the work with a corresponding staff and material available.

These two types of groups are represented by the following symbols:—

First type: $QLLLx_1$ $llllx_2$ $BBDDx_3$ $FVKdx_4$ $wwGGx_5$ y_1 y_2 y_3 y_4 z.

Second type: $QLLLx_1$ $llllx_2$ $BBDDx_3$ $FVKdx_4$ $wwGGx_5$ $TTttx_6$ $CNWrx_7$ y_1 y_2 y_3 y_4 z. Where QLl gives position of observing ship and BB, $DD_1F_1V_1$ have the usual significance according to the International code.

K = the state of the sea according to the following code:—

	STATE OF THE SEA.	Numbers telegraphed.
Slight swell to swell and	Without swell	0
	swell	1
	big swell	2
	extensive swell	3
	turbulent swell	4
Heavy sea and	Without swell	5
	swell	6
	big swell	7
	extensive swell	8
	turbulent swell	9

d = the direction from which the waves of the swell come will be

expressed according to the following code :—

Numbers telegraphed.	Direction from which the swell comes.
0	There is no swell.
1	The swell comes from the N.E.
2	,, ,, E.
3	,, ,, S.E.
4	,, ,, S.
5	,, ,, S.W.
6	,, ,, W.
7	,, ,, N.W.
8	,, ,, N.

ww = weather at time of observation.
GG = time of observation in relation to the Greenwich meridian.
TT = temperature of air in complete degrees.
tt = temperature of sea-surface.
C = form of clouds.
N = total amount of clouds.
r = time that rain began to fall.
W = past weather.

CONFIRMATION CIPHERS.

As boats telegraph on many occasions a long way from any land station, there is no means of finding mistakes that may occur in the wording of radiograms or in their transmission by comparison with the results of another station near, as happens with land stations ; for this reason it was agreed in London to introduce into the wording of groups, confirmatory ciphers x_1 x_2 . . . . y_1 y_2 . . . . Z which are calculated and arranged in the following manner :—

Let us examine the case of the second type of radiograms :

QLLL x_1 — x_1 is equal to the significant cipher of the units of the sum Q + L + L + L.
llllx_2 — x_2 ditto do. of l + l + l + l.
BBDD x_3 — x_3 ditto do. of B + B + D + D.
FVKd x_4 — x_4 ditto do. of F + V + K + d.
wwGG x_5 — x_5 ditto do. of w + w + G + G.
TTtt x_6 — x_6 ditto do. of T + T + t + t.
CNWr x_7 — x_7 ditto do. of C + N + W + r.

y_1 is equal to the significant cipher of the units of Q + l + B + F + w + T + C.
y_2 ditto do. L + l + B + V + w + T + N
y_3 ditto do. L + l + D + K + G + t + W
y_4 ditto do. L + l + D + d + G + t + r.
z = significant cipher of the units of $x_1 + x_2 + \ldots x_7$.

EXAMPLE OF THE WORDING OF A RADIOGRAM.

Let us suppose that an observation is being made on a boat at 7h from the Greenwich meridian and is situated in the Western quadrant of Greenwich, North of the Equator, at 120° 35′ of longitude and 60° 27′ of latitude.

		Numbers telegraphed.
Situation	Quadrant, N.W.	5
	Latitude, 60° 27′ 60.5	605
	Longitude, 120° 35′ 120.6	1206
Barometrical Pressure, 762.4		62
Direction of the wind, N.W.		28
Force of the wind, 3		3

Objects are not seen at a half a mile	3
There is a head sea with heavy swell waves	2
The waves of the swell come from the W.	6
The weather, on making the observation, is clear at the zenith but with a dense mist for some time, beginning to get less dense	24
The time of observation was 7 o'clock	07
The temperature of the air was 11°.4	11
And that of the water 11° .6	12
There are stratus in the sky	0
The amount of overcast sky is eight tenths	8
The weather from the last observation was cloudy	1
It did not rain	0

And the radiogram would be :—Name of the boat 56056 — 12069 — 62288 — 33264 — 24073 — 11125 — 08109 — 86644.

Explanation.

5605 6, $5+6+0+5 = 16$, $x_1 = 6$ $\quad$ $5+1+6+3+2+1+0 = 18$, $y_1 = 8$
1206 9, $1+2+0+6 = 9$, $x_2 = 9$ $\quad$ $6+2+2+3+4+1+8 = 26$, $y_2 = 6$
6228 8, $6+2+2+8 = 18$, $x_3 = 8$ $\quad$ $0+0+2+2+0+1+1 = 6$, $y_3 = 6$
3326 4, $3+3+2+6 = 14$, $x_4 = 4$ $\quad$ $5+6+8+6+7+2+0 = 34$, $y_4 = 4$
2407 3, $2+4+0+7 = 13$, $x_5 = 3$
1112 5, $1+1+1+2 = 5$, $x_6 = 5$
0810 9, $0+8+1+0 = 9$, $x_7 = 9$

8664 4

$$x_1 - x_2 - x_3 - x_4 - x_5 - x_6 + x_8 = 44 \quad z = 4$$

SWEDEN

Transmitting station : Karlsborg (call signal SAJ).
Wavelength : 4,200 m. C.W.
Times of transmission : 0840 (G.M.T.) (Observations at 0700 G.M.T.)
1440 ,, ,, ,, 1300 ,,
1940 ,, ,, ,, 1800 ,,

Observations relate to the following stations :—

Station No.	Station.	Notes.
03	Abisko....	Code A (below), see also (*a*)
11	Haparanda	Code A
15	Stensele	Code A
22	Ostersund	Code A
24	Hërnösand	Coastal station, Code B (below)
28	Saerna	Code A
36	Karlstad	Code A
37	Stockholm	Code A
48	Jönköping	Code A
52	Wisby	Coastal station, Code B
58	Kalmar	Coastal station, Code B

Code A.—For 7h. reports BBBDD FwwTT cbWVH ALaNh RRmmr.
For 13h. and 19h. reports BBBDD FwwTT cbWVH ALaNh RRmmr.

Code B.—For 7h. reports BBBDD FwwTT cbWVH ALaNh RRSv$_5$r.
For 13h. and 18h. reports BBBDD cbWVH RRSv$_5$r.

(*a*).—03 Abisko also issues a final group of nephoscope observations in code C_1ddVV. The unit VV is such that if h is the height of the cloud in metres, the true velocity vv is given in metres per second by the equation—

$$vv = \frac{h}{1000} V.$$

NOTES.—Additional stations may be inserted in place of the above normal stations, which may fail occasionally.

Pilot balloon ascents are added from time to time at the end of the morning and afternoon messages. These ascents are taken the same morning at the following stations :—

03 Abisko, 22 Östersund, 37 Stockholm.

Code : $h_1$ddvv in metres per second.

Meteorological messages containing the weather forecasts, prepared by the Central Meteorological Institute in Stockholm, are sent out at request to ships from the stations of Boden, Hernösand, Vaxholm, Gottland, Karlskrona and Gothembourg. The five last-named stations also give information concerning ice. Thus the station of Hernösand furnishes ice reports from the district between the light-place of Svartklubben and the pilot station of Salmi, the stations of Vaxholm and Gottland from the district between the light-place of Olands södra udde and the pilot station of Salmi, the station Karlskrona from the district between the light-place of Kullen to the pilot Station of Salmi and the station of Gothembourg from the district between the pilot station of Dyngö and the pilot station of Aspö.

The information is given in plain language. A charge of 8 francs is collected from the ships for each transmission of a weather or ice report.

Compass Station :—Vinga (call signal SAL), position 11° 30′ 10″ E. ; 57° 38′ 00″ N. Wavelength 600 m. (Vinga is controlled by Göteborg.)

Ships desiring compass bearing should call Göteborg sending QTE (quel est mon relèvement vrai depuis . . . .). Then the ship should await instructions. Göteborg gives the result by means of the signal QTE (votre relèvement vrais depuis . . . . était de . . . . degrés) followed by the call signal of the station having determined the bearing and a group of three figures (000 to 359). This group indicates in degrees measured clockwise the true bearing of the ship from Vinga. Immediately after receiving the result the ship should acknowledge in the ordinary way and give signal "fin de travail" which is repeated by Göteberg. No tax is collected for the bearings.

A brief report of the result should be sent to "Administration Générale des Télégraphes, Division radio-télégraphique, Stockholm 2."

TUNIS (North Africa)

Transmitting station : Bizerta (Sidi-Abdallah, FUA)

Wavelength : 1,350 m. Spark at 12.00 (G.M.T.) ; 5150 m. C.W. at other times.

Times of sending :				
0315	(Observations	at	0100	G.M.T.)
0920	,,	,,	0700	,,
1200	,,	,,	0700	,,
1500	,,	,,	1300	,,
2020	,,	,,	1800	,,

The 1200 message commences with the words "Meteo Alger" ; the remaining messages with the words "Meteo Afrique."

0315 *Message.*—0100 Observations from Tunis.

Code: BBBDD FWTT βbb

This is followed by a repetition of the 0300 report from Oran.

0920 *Message.*—0700 Observations from—

61 Tunis.
62 Bizerta (Carouba)
63 Sfax.

Code: Station number (two figures) BBBDD FWTTV βbbRR MMmmu.
Where V denotes visibility (special code, *see* Algeria).
Groups giving upper winds in the Eiffel Tower Code may be added for Bizerta.
The message also contains a repetition of the 0900 report from Oran.

NOTE.—The observation of state of sea in groups relating to Bizerta is made at Cap Blanc.

1500 *and* 2020 *Messages.*—1300 and 1800 observations respectively from the above Tunisian Stations, together with a repetition of the 1445 and 2000 reports, respectively from Oran.
Code: BBBDD FWTT βbb.
1200 *Message.*—The same as that from Oran at 1145 with the addition of the stations:—

Sfx. = Sfax (S)		
Bzr. = Bizerta (Carouba) (S)		
Gar. = Cap de Garde (S)	}	(S) = Coastal Station.
Cst. = Constantine (L)		(L) = Inland Stations.
Tgr. Tangier (S)		
Rab. Rabat (S)		

TURKEY

Weather reports are issued three times daily from Constantinople (OSM) at 0830, and 1700 (G.M.T.)

[Observations at 0500 and 0800 for 0830 message and 1500 for 1700 message.]

Wavelength: 8,000 m. C.W.

Messages commence "Meteo Constantinople a FL pour PHISERAR PARIS"—then date and hour followed by observations from Constantinople

Code: Old International.
Message of 5h., BBBDD FWTTC βbbRR MMmm.
Messages of 8h. and 15h., BBBDD FWTTC βbbRR.

UNITED STATES OF AMERICA

TRANSMISSION OF TIME SIGNALS AND HYDROGRAPHIC INFORMATION BY NAVAL RADIO STATIONS.

The transmission of time signals to vessels at sea by means of radiotelegraphy was first accomplished in the United States in 1905, and this service, enlarged and extended, has continued to the present time. This service is of the greatest value to mariners, as it furnishes a means by which the time, as given by the transmitted signals, may be compared with a ship's chronometer and the error of the chronometer found. Similar comparisons over a number of days enable data to be obtained by which not only the error may be found but also the chronometer rate; that is, the rate at which it is gaining or losing.

The noontime signals on the Atlantic coast are sent out through the coast radio stations by connection with Western Union Telegraph lines from the United States Naval Observatory at Washington, D.C. By the operation of proper relays in electrical circuits, the beats of the seconds of a standard clock

in the observatory are sent out broadcast as a series of radio dots, commencing five minutes before the time of the final signal. By omitting certain dots in a series, the comparison between the dots and the beats of the chronometer seconds can be checked until the instant of local noon (seventy-fifth meridian time) is reached. This is marked by a longer dot, which gives the time of exact noon. A comparison with the chronometer time at that instant gives its error referred to the seventy-fifth meridian time. Applying the difference in longitude, namely five hours, between the seventy-fifth meridian and Greenwich, which is the standard meridian (or 0° longitude), the error of the chronometer referred to Greenwich time is determined.

Time signals are now sent out on the Atlantic coast only through the radio stations at Washington (NAA), Annapolis (NSS), Key West (NAR), and New Orleans (NAT). Signals from Washington, Annapolis and Key West are sent out every day in the year twice a day, *viz.*, from 11.55 a.m. to noon, and from 9.55 to 10 p.m., seventy-fifth meridian time. Time signals from New Orleans are sent out daily, including Sundays and holidays, commencing at 11.55 a.m., seventy-fifth meridian standard time, and ending at noon.

On the Pacific coast the time signals are sent broadcast to sea through the naval radio stations at San Francisco (NPH), Eureka (NPW), Point Arguello (NPK), and San Diego, Calif. (NPL), and at North Head, Wash. (NPE). The controlling clock for each station is in the naval observatory at the Mare Island Navy Yard. Signals from all these stations are sent out every day from 11.55 to noon, one hundred and twentieth meridian standard time, but point Arguello, and San Diego do not send on Sundays and holidays.

On the Great Lakes the time signals are sent broadcast through the naval radio station at Great Lakes, Ill. (NAJ), daily, except on Sundays and holidays, from 10.55 a.m. to 11 a.m., ninetieth meridian standard time.

To get the maximum clearness of signals, the receiving circuit should be tuned to that of the sending station. The wavelengths used are as follows :—

Annapolis	17,000 metres.
Washington	2,500 metres.
San Francisco	2,400 and 4,800 metres.
North Head	2,800 metres.
San Diego	2,400 and 9,800 metres.
Eureka	2,000 metres.
Great Lakes	1,512 metres.
Key West	1,500 metres.
Point Arguello	1,512 metres.
New Orleans	1,000 metres.

Both San Francisco and San Diego transmit time signals on undamped waves simultaneously with the transmission on damped waves, using an arc transmitter in each case. The arc transmitter is far more powerful than the spark transmitter, and the signals should be audible over a much greater range. They can, of course, only be received on apparatus specially equipped to receive undamped signals.

PANAMA.

Time is transmitted by Balboa (Canal Zone), call letters NBA, at 12.55 to 1 p.m. and at 4.55 to 5 a.m., seventy-fifth meridian time, on 7,000 metres. Undamped waves are used, but so interrupted by a chopper as to be audible on a crystal detector.

Also time is transmitted by Colon (Canal Zone), call letters NAX, at the same times, on 1,500-metre spark.

In this connection it will be noted that Darien has been operated by distant control from Balboa. The station is called Balboa, and the call NBA is used for both.

At 1 p.m. daily, seventy-fifth meridian time, a time-ball is dropped from the top of the mast on the Signal Station on Sosa Hill, Balboa.

The following table summarises the issues in a convenient form :—

Station.	Call Letters.	Wave-Lengths.	When sent.
		Metres.	
Washington	NAA	2,500	Daily at 11.55 a.m. to noon and 9.55 p.m. to 10.00 p.m., standard time, 75th meridian. 1655–1700, 0255–0300 G.M.T.
Annapolis	NSS	17,000 (arc)	Daily at 11.55 a.m. to noon and 9.55 p.m. to 10.00 p.m. standard time, 75th meridian. 1655–1700, 0255–0300 G.M.T.
Key West	NAR	1,500	Daily at 11.55 a.m. to noon, standard time, 75th meridian. 1655–1700 G.M.T.
New Orleans	NAT	1,000	Daily at 11.55 a.m. to noon, standard time, 75th meridian. 1655–1700 G.M.T.
Balboa, Panama ..	NBA	7,000 (arc)	Daily at 4.55 to 5.00 a.m. and 12.55 to 1.00 p.m., standard time, 75th meridian. 0955–1000, 1755–1800 G.M.T.
Colon, Panama ..	NAX	1,500 (spark)	Daily at 4.55 to 5.00 a.m. and 12.55 to 1.00 p.m., standard time, 75th meridian, 0955–1000, 1755–1800 G.M.T.
Cavite, Philippines ..	NPO	952 (spark) 5,000 (arc)	Daily at 10.55 to 11.00 a.m. and 9.55 to 10.00 p.m., standard time, 120th meridian, East. 0255–0300, 1355–1400 G.M.T.
North Head, Wash. ..	NPE	2,800	Daily at 11.55 a.m. to noon, standard time 120th meridian, West. 1955–2000 G.M.T.
Eureka, Calif. ..	NPW	2,000	Daily at 11.55 a.m. to noon, standard time, 120th meridian, West. 1955–2000 G.M.T.
Point Arguello, Calif.	NPK	1,512	Daily, except Sundays and holidays, at 11.55 a.m. to noon, standard time, 120th meridian, West. 1955–2000 G.M.T.
San Diego, Calif. ..	NPL	9,800 (arc) 2,400 (spark)	Daily, except Sundays and holidays, at 11 55 a.m to noon, standard time, 120th meridian, West. 1955–2000 G.M.T.
San Francisco, Calif. ..	NPH	4,800 (arc) 2,400 (spark)	Daily at 11.55 a.m. to noon, standard time, 120th meridian, West. 1955–2000 G.M.T.
Great Lakes, Ill. ..	NAJ	1,512	Daily, except Sundays and holidays, at 10.55 a.m. to 11.00 a.m., standard time, 90th meridian. 1655–1700 G.M.T.
Pearl Harbour, Hawaii	NPM	11,200 (arc) 600 (spark)	Daily at 180th meridian mean noon. 2400 G.M.T.

INFORMATION RELATING TO HYDROGRAPHIC REPORTS.

To Masters of All Vessels.

(1) The Hydrographic Office and the Naval Communication Service are prepared, on and after November 10th, 1921, to collect and distribute hydrographic information by naval radio. The co-operation of owners, operators, radio companies controlling installations on board vessels, and masters, is necessary to make this new undertaking a success. In return, greater protection will be afforded mariners than ever before.

In addition to distributing hydrographic information by radio, the Hydrographic Office will continue to publish, as at present, in the Daily Memorandum, Hydrographic Bulletin or Notice to Mariners, confirmation of hydrographic information distributed by radio.

(2) *Expense*.—The naval radio stations will make no charge for reception of messages containing hydrographic information, provided such messages are checked "Govt. Hydro." and will arrange to furnish this information to the nearest Branch Hydrographic Office free. The ship sending charge, if any, will have to be borne by the sending vessel. Any other expense in connection with the receipt and distribution of this information will be borne by the Hydrographic Office.

(3) *Procedure.*—The procedure, as far as masters of vessels are concerned, may be divided into two parts :—

(*a*) Sending hydrographic information to naval radio station ;

(*b*) Receiving information twice daily when in radio range of the distributing station of its zone.

SENDING INFORMATION.

Vessels co-operating in this service should transmit messages in plain English direct to United States Naval Radio Stations as follows :—

ATLANTIC OCEAN.

North of latitude 42° 00′ N., to Boston Naval Radio Station. Call letters, NAD.

Between latitude 39° 30′ N., and 42° 00′ N., to New York Naval Radio Station. Call letters, NAH.

Between latitude 38° 30′ N., and 39° 30′ N., to Philadelphia Naval Radio Station. Call letters, NAI.

Between latitude 33° 00′ N., and 38° 30′ N. (including entrance to Chesapeake Bay) to Norfolk Naval Radio Station. Call letters, NAM.

Chesapeake Bay (except entrance) to Norfolk Naval Radio Station. Call letters, NAM. Or to Baltimore Naval Radio Station. Call letters, NBZ.

South of latitude 33° 00′ N., and north-east of line joining Cape Sable, Florida and Cay Piedras, Cuba, to Charleston Naval Radio Station. Call letters, NAO.

GULF OF MEXICO.

Between the line joining Cape Sable, Florida and Cay Piedras, Cuba, and the line joining Ship Shoal Light, La., and Cape Catoche, Yucatan (including Yucatan Channel) to New Orleans Naval Radio Station. Call letters, NAT.

In the Gulf of Mexico west of the line joining Ship Shoal Light, La., and Cape Catoche, Yucatan, to Galveston Naval Radio Station. Call letters, NKB.

CARIBBEAN SEA.

In the Caribbean Sea, report to Naval Radio Station, Colon. Call letters, NAX.

PACIFIC OCEAN.

Between the Equator and latitude 20° 00′ N., to Balboa Naval Radio Station. Call letters, NBA.

Between latitude 30° 00′ N., and 42° 00′ N., to San Francisco Naval Radio Station. Call letters, NPG.

Between 42° 00′ N., and 46° 00′ N., to North Head Naval Radio Station. Call letters, NPE.

North of latitude 46° 00′ N. (including Puget, Vancouver and Queen Charlotte Sounds, and Alaskan waters) to Seattle Naval Radio Station. Call letters, NVL.

GREAT LAKES.

Lake Ontario and the St. Lawrence River above Montreal, to Buffalo Naval Radio Station. Call letters, NNZ.

Lake Erie, Lake Huron and Georgian Bay, to Cleveland Naval Radio Station. Call letters, NRH.

Lake Michigan to Chicago Naval Radio Station. Call letters, NUR.

Lake Superior, and the waters connecting this lake with Lake Michigan, Lake Huron and Georgian Bay, to Duluth Naval Radio Station. Call letters, NUX.

(4) These naval radio stations stand continuous watch and are prepared to receive hydrographic messages at any time. Vessels should transmit information as soon as they are in normal radio range of the radio station.

Vessels are requested to inform the Hydrographic Office if they have any trouble in " raising " a station or transmitting the hydrographic message.

(5) *Preparation of Message*.—In preparing information for transmission it is desired that messages be concise as consistent with exactness and clearness. The order of the message will be in the order of the importance of the items. To promote uniformity, the following order of subjects is recommended :—

1.—Derelicts and sunken wrecks.
2.—Mines.
3.—Ice.
4.—Aids to navigation adrift.
5.—Floating rafts, logs, wreckage.
6.—Misplaced buoys in approaches to harbours.
7.—Other items considered sufficiently important to broadcast.

NOTE.—It is not intended to forward information by radio unless danger to a vessel is involved, either from collision or a resulting inadequacy of aids to navigation.

(6) *Confirmation*.—Vessels are requested to forward by first mail to the Branch Hydrographic Office concerned a confirmation copy of all radio messages sent.

RECEIVING INFORMATION.

(7) The latest available hydrographic information of each zone will be distributed from its assigned radio station as follows :—

ATLANTIC OCEAN.

(*a*) Information of the zone south of the forty-fifth parallel and northeast of a line joining POINT JUDITH and NANTUCKET SHOAL LIGHT VESSEL and north of the parallel passing through NANTUCKET SHOAL LIGHT VESSEL (at present latitude 40° 37′ 02″ N.) will be broadcasted from Boston Naval Radio Station. Schedule 11.00 a.m., 5.00 p.m. Wavelength, 1,620 AR.

(*b*) Information of the zone included between the parallels 42° 00′ N. and 39° 30′ N. will be broadcasted from the New York Naval Radio Station. It is to be noted that this zone intentionally overlaps the Boston zone. Schedule, 10.30 a.m., 5.00 p.m. Wavelength, 1,832, AR.

(*c*) Information of the zone included between latitude 39° 30′ N. and latitude 38° 30′ N., including the Delaware River and Bay, will be broadcasted from the Philadelphia Naval Radio Station. Schedule, 10.45 a.m., 5.00 p.m. Wavelength, 1,948, AR.

(*d*) Information of the zone included between 38° 30′ N. and 33° 00′ N., the entrance to Chesapeake Bay, Hampton Roads, Newport News and Norfolk, will be broadcasted from the Norfolk Naval Radio Station. Schedule, 10.45 a.m., 4.00 p.m. Wavelength, 1,851, AR.

(*e*) Information of Chesapeake Bay, except Newport News and Norfolk, will be broadcasted from the Baltimore Naval Radio Station. It is to be noted that this overlaps with Norfolk on Hampton Roads and the entrance to Chesapeake Bay. Schedule, 10.30 a.m., 4.00 p.m. Wavelength, 700, AR.

(*f*) Information of the zone south of 33° 00′ N. and northeast of a line joining CAPE SABLE, FLA., and CAY PIEDRAS, CUBA, will be broadcasted from the Charleston Naval Radio Station. Schedule, 10.30 a.m., 6.00 p.m. Wavelength, 2,250, AR.

GULF OF MEXICO.

(*g*) Information of the GULF OF MEXICO between the line CAPE SABLE, FLA. and CAY PIEDRAS, CUBA, and the line SHIP SHOAL LIGHT, LA., and CAPE CATOCHE, YUCATAN, including the YUCATAN CHANNEL, will be broadcasted from the New Orleans Naval Radio Station. Schedule, 11.00 a.m., 5.00 p.m. Wavelength, 1,832, AR.

(*h*) Information of the GULF OF MEXICO, west of the line SHIP SHOAL LIGHT, LA., and CAPE CATOCHE, YUCATAN, will be broadcasted from the Galveston Naval Radio Station. Schedule, 11.30 a.m., 6.30 p.m. Wavelength, 1,813, AR.

CARIBBEAN SEA.

(*i*) Information of the Caribbean Sea will be broadcasted from the Colon Naval Radio Station immediately after radio time signals. Schedule, 5.00 a.m., 1.00 p.m. Wavelength, 1,620, AR.

PACIFIC OCEAN.

(*j*) Information of the zone between the Equator and latitude 20° 00′ N. will be broadcasted from the Balboa Naval Radio Station immediately after radio time signals. Schedule, 5.00 a.m., 1.00 p.m. Wavelength, 10,110, CW.

(*k*) Information of the zone included between latitude 33° 00′ N. and latitude 42° 00′ N. will be broadcasted from the San Francisco Naval Radio Station. Schedule and wavelength will be announced later.

(*l*) Information of the zone included between 42° 00′ N. and 46° 00′ N. will be broadcasted from the North Head Naval Radio Station. Schedule and wavelength will be announced later.

(*m*) Information of the zone north of 46° 00′ N., including VANCOUVER and QUEEN CHARLOTTE SOUNDS and ALASKAN WATERS, will be broadcasted from the Seattle Naval Radio Station. Schedule and wavelength will be announced later.

GREAT LAKES.

(*n*) Information of LAKE ONTARIO and the ST. LAWRENCE RIVER above MONTREAL will be broadcasted from the Buffalo Naval Radio Station. Schedule, 10.45 a.m., 5.00 p.m. Wavelength, 1,200, AR.

(*o*) Information of LAKE ERIE, LAKE HURON and GEORGIAN BAY, will be broadcasted from the Cleveland Naval Radio Station. Schedule, 11.00 a.m., 5.30 p.m. Wavelength, 1,080, AR.

(*p*) Information of LAKE MICHIGAN will be broadcasted from the Chicago Naval Radio Station. Schedule, 11.00 a.m., 5.30 p.m. Wavelength, 1,200, AR.

(*q*) Information of LAKE SUPERIOR, and the waters connecting this lake with LAKE MICHIGAN, LAKE HURON and GEORGIAN BAY, will be broadcasted from the Duluth Naval Radio Station. Schedule, 10.45 a.m., 4.15 p.m. Wavelength, 1,200, AR.

The arrangements for collecting, digesting and distributing hydrographic information are complete; it remains for masters of vessels to make this undertaking a success, for information must be received before it can be distributed.

INTERNATIONAL ICE OBSERVATION AND ICE PATROL SERVICE.

For the purpose of carrying on the International Ice Observation and Ice Patrol Service provided for by the International Convention for the Safety of Life at Sea, London, 1913–14, the U.S. Coastguard cutters *Ossipee* and *Seneca* have been detailed for this service.

The object of the Ice Patrol Service is to locate the icebergs and field ice nearest to the transatlantic steamship lane. It will be the duty of patrol vessels to determine the southerly, easterly, and westerly limits of the ice, and to keep in touch with these fields as they move to the southward, in order that radio messages may be sent out daily, giving the whereabouts of the ice, particularly the ice that may be in the immediate vicinity of the regular transatlantic steam lane.

During the months of April, May, and June, and as much longer as necessary, these two vessels will obtain fuel and other necessary supplies

at Portland, Me., and Boston, Mass., respectively. They will alternate on patrol, making alternate cruises of about fifteen days in the ice region; the fifteen days to be exclusive of time occupied in going to and from base. The movements of the vessels will be so regulated that on the fifteenth day after reaching the ice region the vessel on patrol will be relieved by the second vessel, if possible, at which time the first vessel will proceed to base, replenish her coal supply, and return in time to relieve the other vessel at the end of the latter's fifteen-day cruise. It is important that the patrol be continuous, and the vessel on patrol will not leave her station until relieved by the other vessel unless it is absolutely necessary to do so.

Having located the ice, the patrol vessel will send the following daily radiograms. All time in radiograms will be in 75th meridian time.

(*a*) At 6 p.m. (75th meridian time) ice information will be sent broadcast for the benefit of vessels, using 600 metre wavelength. This message will be sent three times, with an interval of two minutes between each.

(*b*) At 4 a.m (75th meridian time) a radiogram will be sent to the Branch Hydrographic Office, New York City, through the nearest land radio stations, defining the ice danger zone, its southern limits, or other definite ice news. The telegraphic address of the Branch Hydrographic Office is " Hydrographic, New York."

(*c*) Ice information will be given at any time to any ship with which the patrol vessel can communicate.

Ice information will be given in as plain, concise English as practicable, and will state in the following order :—

(*a*) Ice (berg or field).
(*b*) Date.
(*c*) Time (75th meridian time).
(*d*) Latitude.
(*e*) Longitude.
(*f*) Other data as may be necessary.

While on this duty the patrol vessel will endeavour by means of daily radio messages to keep ships at sea advised of the limits of the ice fields, etc.

The radio messages from the patrol ships will be given publicity immediately upon their receipt by the Branch Hydrographic Office, New York, and by the Hydrographic Office, Washington, D.C.

Transmission of Weather Reports by Naval Radio Stations.

Through co-operation with local offices of the United States Weather Bureau, weather forecasts are sent broadcast to sea through naval coast radio stations at certain times, varying with the locality. Coast stations are generally prepared to give local forecasts to passing vessels without charge, on request. Storm warnings are sent whenever received.

General Report.

A general report of weather conditions in America is understood to be issued or about to be issued twice daily from Annapolis (17,000 m.) at 0130 and 1330 G.M.T.

Atlantic and Gulf Coasts.

Distribution of Weather Bulletins and Storm Signals by W/T Stations.

A systematic broadcasting of weather bulletins, storm and hurricane warnings by United States Naval W/T stations on the Atlantic and Gulf Coasts, and in the Carribbean Sea is now in force. This distribution supplements the general broadcasting of weather bulletins and storm signals from the high power W/T stations at Arlington (Virginia), Key West (Florida), Point Isabel (Texas), San Juan (Porto Rico) and Great Lakes (Illinois).

Whenever a storm or hurricane warning is based on the meteorological observations taken at 1300, it will be transmitted at the same time as the weather bulletin. When based on special observations it will be transmitted at the time indicated.

I.—St. Petersburg (Florida) W/T Station.

Position.—Lat. 27° 57′ N., long. 82° 26′ W. (approx.).
Call signal.—NGL.

Wavelength.—2,700 metres.

Details.—At 1630 wind and weather forecasts and storm warnings for west Florida coast, Key West to Apalachicola; advisory messages relating to storm warnings issued for the South Atlantic and Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Tampa and Key West.

At 0000 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto sent as necessary and repeated every two hours until 0500.

II.—Pensacola (Florida) W/T Station.

Position.—Lat. 30° 21′ N., long. 87° 16′ W. (approx.).
Call signal.—NAS.
Wavelength.—2,250 metres.

Details.—At 1645 wind and weather forecasts and storm warnings for Florida and Alabama coasts, Apalachicola to Bay St. Louis; advisory messages relating to storm warnings issued for South Atlantic and Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Pensacola.

At 2300 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto sent as necessary, and repeated every two hours until 0500.

III.—New Orleans W/T Station.

Position.—Lat. 29° 57′ N., long. 90° 02′ W. (approx.).
Call Signal.—NAT.
Wavelength.—1,832 metres.

Details.—At 1600 wind and weather forecasts and storm warnings for Louisiana and Texas Coasts, Bay St. Louis to Port Arthur; advisory messages relating to storm warnings issued for South Atlantic and Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Burrwood and Port Arthur.

At 2200 storm warnings and advices..............................

Hurricane warngings and advisory messages relating thereto sent as necessary, and repeated every two hours until 0500.

IV.—Galveston W/T Station.

Position.—Lat. 29° 19′ N., long. 94° 47′ W. (approx.).
Call signal.—NKB.
Wavelength.—1,813 metres.

Details.—At 1630 wind and weather forecasts and storm warnings for Texas Coast, Port Arthur to Corpus Christi; advisory messages relating to storm warnings issued for the West Gulf Coast; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Galveston.

At 2300 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto send as necessary, and repeated every two hours until 0500.

V.—Point Isabel (Texas) W/T Station.

Position.—Lat. 26° 04′ N., long. 97° 12′ W. (approx.).
Call signal.—NAY.
Wavelength.—2,250 metres.

Details.—At 1700 wind and weather forecasts and storm warnings for Texas Coast, Corpus Christi to Brownsville; advisory messages relating to storm warnings issued for the West Gulf Coast.

At 0000 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto send as necessary, and repeated every two hours until 0500.

VI.—Portland (Maine) W/T Station.

Position.—Lat. 43° 34′ N., long. 70° 12′ W. (approx.).
Call Signal.—NAB.
Wavelength.—1,620 metres.

Details.—At 1700 wind and weather forecasts and storm warnings for Maine Coasts Eastport to Portsmouth; advisory messages regarding storm warnings issued for North Atlantic Coast; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Portland.

At 0100 storm warnings and advices..............................

VII.—Boston (Massachusetts) W/T Station.

Position.—Lat. 42° 21′ N., long. 70° 57′ W. (approx.).
Call signal.—NAD.
Wavelength.—2,250 metres.

Details.—At 1600 wind and weather forecasts and storm warnings for New Hampshire, Massachusetts, and Rhode Island Coasts; advisory messages regarding storm warnings issued for North Atlantic Coast; and observation taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Highland Light, Nantucket and Block Island.

At 2200 storm warnings and advices..............................

VIII.—New York W/T Station.

Position.—Lat. 40° 28′ N., long. 74° 00′ W. (approx.).
Call signal.—NAH.
Wavelength.—1,832 metres.

Details.—At 1530 wind and weather forecasts and storm warnings for New York and Connecticut Coasts; forecasts Sandy Hook to Grand Banks for European steamers; advisory messages regarding storm warnings issued for north and middle Atlantic Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Sandy Hook.

At 2200 storm warnings and advices..............................

IX.—Philadelphia W/T Station.

Position.—Lat. 39° 52′ N., long. 75° 11′ W. (approx.).
Call signal.—NAI.
Wavelength.—1,948 metres.

Details.—At 1545 wind and weather forecasts and storm warnings for New Jersey, Delaware and Maryland Coasts; advisory messages regarding storm warnings issued for north and middle Atlantic Coasts; and observations taken at 1300 for wind direction and velocity, and state of weather at Delaware breakwater.

At 2200 storm warnings and advices..............................

X.—Baltimore (Maryland) W/T Station.

Position.—Lat. 39° 17′ N., long. 76° 37′ W. (approx.).
Call signal.—NBZ.
Wavelength.—700 metres.

Details.—At 1530 wind and weather forecasts and storm warnings for Chesapeake Bay; advisory messages regarding storm warnings issued for middle and South Atlantic Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Baltimore and Norfolk.

At 2100 storm warnings and advices..............................

XI.—Norfolk (Virginia) W/T Station.

Position.—Lat. 36° 50′ N., long. 76° 18′ W. (approx.).
Call signal.—NAM.
Wavelength.—1,851 metres.

Details.—At 1515 wind and weather forecasts and storm warnings for Virginia and North Carolina Coasts; advisory messages regarding storm warnings issued for Chesapeake Bay and middle and South Atlantic Coasts.

At 0100 and 2100 storm warnings and advices.....................

Advisory messages regarding hurricanes are sent when necessary and repeated every two hours until 0500.

Observations taken at 0100 and 1300 for barometric pressure, state of weather, wind direction and velocity, condition of sea and visibility at Cape Henry and Cape Hatteras are sent at 0130 and 1330 respectively.

XII.—Charleston (South Carolina) W/T Station.

Position.—Lat. 32° 51′ N., long. 79° 58′ W. (approx.).
Call signal.—NAO.
Wavelength.—2,250 metres.

Details.—At 1530 wind and weather forecasts and storm warnings for South Carolina Coast; advisory messages relating to storm warnings issued for middle, South Atlantic and East Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Charleston.

At 2300 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto sent as necessary and repeated every two hours until 0500.

XIII.—Savannah (Georgia) W/T Station.

Position.—Lat. 32° 05′ N., long. 81° 07′ W. (approx.).
Call signal.—NEV.
Wavelength.—1,813 metres.

Details.—At 1600 wind and weather forecasts and storm and hurricane warnings for Georgia Coast; advisory messages relating to storm warnings issued for middle and South Atlantic and East Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Savannah.

At 2300 storm warnings and advices..............................

Hurricane warnings and advisory messages relating thereto sent as necessary and repeated every two hours until 0500.

XIV.—Jacksonville (Florida) W/T Station.

Position.—Lat. 30° 19′ N., long. 81° 39′ W. (approx.).
Call signal.—NFI.
Wavelength.—450 metres.

Details.—At 1600 wind and weather forecasts and storm and hurricane warnings for east Florida Coast, Jacksonville to Miami; advisory messages relating to storm warnings issued for middle and South Atlantic and East Gulf Coasts; and observations taken at 1300 for barometric pressure; wind direction and velocity, and state of weather at Jacksonville and Titusville.

At 2300 storm warnings and advices issued in afternoon..............

Hurricane warnings and advisory messages relating thereto sent as necessary, and repeated every two hours until 0000.

XV.—St. Augustine (Florida) W/T Station.

Position.—Lat. 29° 53′ N., long. 81° 17′ W. (approx.).
Call signal.—NAP.
Wavelength.—1,851 metres.

Details.—At 1630 wind and waether forecasts and storm warnings for East Florida Coast, Jacksonville to Miami; advisory messages relating to storm warnings issued for middle and South Atlantic and East Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Jacksonville and Titusville.

At 0000 storm warnings and advices issued in afternoon..............

Hurricane warnings and advisory messages relating thereto sent as necessary, and repeated every two hours until 0500.

XVI.—Maimi (Florida) W/T Station.

Position.—Lat. 25° 48′ N., long. 80° 08′ W. (approx.).
Call signal.—NGE.
Wavelength.—1,620 metres.

Details.—At 1630 wind and weather forecasts and storm warnings for East Coast of Florida, Miami to Key West; advisory messages relating to storm warnings issued for the middle and South Atlantic and East Gulf Coasts; and observations taken at 1300 for barometric pressure, wind direction and velocity, and state of weather at Miami.

At 2300 storm warnings and advices issued in afternoon..............

Hurricane warnings and advisory messages relating thereto sent as necessary, and repeated every two hours until 0500.

XVII.—St. Croix (Virgin Is.) W/T Station.

Position.—Lat. 17° 45′ N., long. 64° 42′ W. (approx.).
Call signal.—NNL.
Wavelength.—450 metres.

Details.—Hurricane and advisory messages relating thereto are transmitted when issued by the San Juan (Porto Rico) Weather Bureau and are repeated every four hours.

XVIII.—St. Thomas (Virgin Is.) W/T Station.

Position.—Lat. 18° 20′ N., long. 64° 56′ W. (approx.).
Call signal.—NBB.
Wavelength.—1,688 metres.

Details.—Hurricane warnings and advisory messages relating thereto are transmitted when issued by the San Juan (Porto Rico) Weather Bureau and are repeated every four hours.

XIX.—Port au Prince (Haiti) W/T Station.

Position.—Lat. 18° 34′ N., long. 72° 20′ W. (approx.).
Call signal.—NSC.
Wavelength.—2,250 metres.

Details.—Hurricane warnings and advisory messages relating thereto are transmitted when issued by the Washington Weather Bureau and are repeated every four hours.

XX.—Guantanamo (Cuba) W/T Station.

Position.—Lat. 19° 55′ N., long. 75° 09′ W. (approx.).
Call signal.—NAW.
Wavelength.—2,750 metres.

Details.—Hurricane warnings and advisory messages relating thereto are transmitted when issued by the Washington Weather Bureau and are repeated every four hours.

Note.—The times given throughout are G.M.T. (civil).

All bulletins begin with the letters U S W B (United States Weather Bureau) and the weather conditions follow. The first three figures of a report represent the barometric pressure in inches (002 = 30.02); the next figure, the fourth in sequence, represents the direction of the wind to the eight points of the compass: 1 = north, 2 = north-east, 3 = east, 4 = south-east, 5 = south, 6 = south-west, 7 = west, 8 = north-west, and 0 = calm. The fifth figure represents the force of the wind on the Beaufort Scale.

In order to simplify the code, no provision has been made for wind force greater than 9, strong gale, on the Beaufort Scale. Whenever winds of force greater than 9 occur, the number representing them is given in words of figures, thus: Ten, eleven, etc.

PACIFIC COAST

Weather bulletins are obtained from the Weather Bureau, San Francisco, by the San Francisco Naval Radio Station at about 8.30 a.m. and 6 p.m., and forwarded by radio to North Head and San Diego as soon as practicable. They are broadcasted by San Francisco, North Head, and San Diego at noon and 10 p.m. on 952 metres immediately after transmission of time signals. Hydrographic information and storm warnings are broadcasted immediately upon receipt by Tatoosh. Puget Sound, North Head, Marshfield, San Francisco, and Point Arguello on 600 and 952 metres in succession, and also after broadcasting local weather report. Local weather reports broadcasted by Tatoosh, North Head, San Francisco and San Diego at 8 a.m. and 4 p.m. on 600 metres and at noon and 10 p.m., 952 metres; and at noon and 10 p.m., by Puget Sound, Marshfield and Point Arguello on 600 meters. Weather report from Farallones Islands is forwarded to San Francisco for Marine Exchange at 8 a.m., noon, and 5 p.m.

The daily bulletin broadcasted by San Francisco, North Head, and San Diego will consist of two parts as for Atlantic coasts.

The points on the Pacific coast from which weather conditions will be furnished are—

T = Tatoosh.
NH = North Head.
E = Eureka.
SF = San Francisco.
SD = San Diego.

The bulletin will begin with the letters U S W B S F, signifying United States Weather Bureau, San Francisco, and the weather conditions will follow in the same code as for Atlantic coasts.

If the weather conditions for any station cannot be supplied, the initial of the station will be given, followed by the word "Missing"; and if any portion of a report cannot be furnished, such porton will be replaced by an equivalent number of letters, X.

The coast line of the western part of the United States will be divided as follows:—

Northern Pacific, Tatoosh to Cape Blanco.
Central Pacific, Cape Blanco to Point Arguello.
Southern Pacific, Point Arguello to San Diego.

The forecast and warning will be in ordinary language, and will cover a period of 24 hours from 5 p.m., date of issue. At the end of the forecast a statement will be made in regard to the location and movement of any barometric depression that may be likely to affect the winds over the ocean.

Example of forecast and warnings:
Northern Pacific missing Central Pacific Wednesday rain heavy southeast winds Southern Pacific moderate southerly winds period Southeast storm warnings displayed Pointarguello to Capeblanco.

PANAMA (CANAL ZONE).

Hydrographic information and weather reports, when received, are broadcasted immediately after 5 a.m. and 1 p.m. time at Balboa (NBA) on 7,000 metres (arc) and by Colon (NAX) on 1,500 metres (spark). At 5 a.m. Balboa (NBA) also broadcasts this information on 2,400 metres spark.

In addition to above, hydrographic information and weather warnings are broadcasted for ships in the Atlantic by Colon (NAX) and, for ships in the Pacific, Cape Mala (NNT), on 600 metres, immediately after receipt and at 8 a.m., noon, 4 p.m., and 8 p.m. (75th meridian time).

Radio Compass Stations.

Radio compass stations have been installed on the Atlantic coast for the purpose of supplying vessels with bearings and positions. These stations are divided into two classes—those operating independently, and others, called harbour-entrance stations, operated under the control of a central control station at harbour entrances in order to guide vessels to the entrance buoys. The independent stations have been located with a view to giving good cross bearings to ships which are not over 150 miles distant from the coast, while the harbour-entrance stations have been located with a view to furnishing vessels with positions when they are within 50 miles of the entrance to the outer channel.

Harbour-entrance radio compass stations differ from those acting independently in that they are connected to and controlled by a central control station.

Instructions Concerning Radio Compass Stations.

1. There follows a list of harbour-entrance radio compass stations:

Harbour entrance.	Compass-control station.	Radio call.
Boston, Mass.	Boston	NAD
New York, N.Y.	New York	NAH
Delaware Capes	Cape May	NSD
Chesapeake Capes	Virginia Beach	NCZ

The following radio compass stations take bearings for Boston:

Place.	Position. Latitude.	Position. Longitude.
	° ′ ″	° ′ ″
Gloucester, Mass.	42 35 19 N	70 41 08 W
Deer Island, Mass.	42 21 15 N	70 57 30 W
Fourth Cliff, Mass.	42 09 40 N	70 42 22 W

The following radio compass stations take bearings for New York :

Place.	Position.					
	Latitude.			Longitude.		
	°	′	″	°	′	″
Fire Island, N.Y.	40	38	07 N	73	12	32 W
Rockaway Beach, Long Island	40	33	52 N	73	52	40 W
Sandy Hook, N.J.	40	28	12 N	74	01	06 W
Mantoloking, N.J.	40	01	30 N	74	03	10 W
Montauk, Long Island	41	03	09 N	71	57	27 W

The following radio compass stations take bearings for Cape May :

Place.	Position.					
	Latitude.			Longitude.		
	°	′	″	°	′	″
Cape May, N.J.	38	56	41 N	74	53	10 W
Cape Henlopen, Del.	38	47	26 N	75	05	10 W
Bethany Beach, Del.	38	32	45 N	75	03	20 W

The following radio compass stations take bearings for Virginia Beach :

Place.	Position.					
	Latitude.			Longitude.		
	°	′	″	°	′	″
Hog Island, Va.	37	22	36 N	75	42	37 W
Smith Island, Va.	37	07	08 N	75	53	42 W
Cape Henry, Va.	36	55	16 N	75	59	51 W

2. To obtain a bearing from independent radio compass stations, call the station from which the bearing is desired in the usual manner and request bearings by means of a conventional signal given below. Simultaneous bearings from two or more compass stations can be obtained by making the call include the other compass stations desired.

3. To obtain bearings from harbour-entrance compass stations carry out the same procedure with the exception that the compass-control station should be called instead of the compass station.

4. When bearings are requested simultaneously from two or more compass stations the compass station which is farthest north will supply the ship with its bearing first ; the others will then follow in the order of their north to south, or east to west, geographical location.

5. The following abbreviated signals will be used until further notice :

Signal.	Meaning.
QTE ?	What is my true bearing ?
QTE	Your true bearing is ——— degrees from ——— radio compass station.
QTF ?	What is my position ?
QTF	Your position is latitude ———, longitude ———.

6. The radio compass station (or compass-control station for harbour-entrance compass stations) will answer requests for bearings and positions in the customary manner of answering calls and follow their call letters with " K " if they desire to take a bearing at that time, " QRX " if they desire the vessel to stand by, or other abbreviated signal authorised by International Regulations.

7. On being told to " K " vessels desiring bearings or positions will transmit their radio call letters for 30 seconds and then make dashes 5 seconds

long for 1 minute, making their call letters 3 times after each 5-second dash and terminating with the conventional signal " K " (go ahead).

8. At the expiration of the direction-determining signals the radio compass station (or compass-control station) will call the vessel, make " QTE," and send the bearing in degrees (0 to 359) and the name of the compass station which obtained the bearing, or " QTF " and the position in latitude and longitude. Bearings and positions will always be transmitted to the vessel in words to avoid error.

9. Vessels acknowledge receipt of bearings and positions by making the call letters of the station transmitting the bearing or position once, " DE," vessel's radio call letters, and then repeats the bearing or position received using numerals.

10. Independent radio compass stations keep watch on 800 metres spark, and this wavelength should always be used to call these stations.

11. Merchant vessels will call all radio compass and compass-control stations on 800 metres and carry out all tests and communication with them thereafter on this wavelength.*

12. Commanders of vessels should note that shore radio compass stations cannot distinguish between the bearing of a ship and its reciprocal unless the reciprocal bears inland. There is, therefore, a possibility of an error of 180 degrees. In such cases the decision is left to the commander of the ship as to which is the correct bearing.

13. Subject to the foregoing, bearings should be accurate within 2 degrees of arc. When bearings from three or more compass stations are not over 2 degrees of an arc in error, but do not meet at a fixed point, the centre of an area enclosed by the bearings can generally be taken as the approximate position of the vessel.

14. The following U.S. naval shore radio compass stations are now in operation for the purpose of furnishing bearings to vessels in the West Atlantic :

Radio Compass Station.	Radio Call.	Position.	
Gloucester, Mass. ..	NAD	Lat. 42° 35′ 19″ N	Long. 70° 41′ 08″ W

NOTE.—The following radio compass stations are temporarily out of commission : Fourth Cliff, Mass. ; Cape Cod, Mass. ; Surfside, Nantucket, Mass. ; Price's Neck, R.I. ; Watch Hill, R.I. ; and Rockaway Beach, N.Y.

* On and after April 1st, 1920, the 800-metre wavelength and no other will be used by all United States Naval shore radio compass stations.

Where two or more of the foregoing compass stations have the same radio call it indicates that they are connected by wire telegraph to and under the control of a central control station, the radio call being the call of the central control station. When a request for bearings is made the central control station invariably answers with a bearing from each of the compass stations under its control.

URUGUAY

The Station of Cerrito radiates each day (excepting Sunday) between 10 p.m. and 11 p.m. (Greenwich mean time) a radiotelegram, issued by the International Meteorological Institute which contains the following information;

(*a*) The situation of centres of atmospheric movement in the southern part of the Continent in the zone between latitude 22° and the extreme south.

(*b*) Observations made at 12.20 p.m. (Greenwich mean time) by the Central Observatory at Monte Video and by stations of the National Service.

(*c*) The most important changes observed between 12.20 and 9 p.m. (Greenwich mean time).

NOTE.—For the wording of this radiotelegram the International Meteorological Telegraph Code will be used.

VIRGIN ISLANDS.

Transmitting Station: St. Croix, NNT. Position 17° 45′ N.; 64° 42′ W.

Wavelength: 450 m.

Hurricane warnings and advisory messages relating thereto are transmitted when issued by the San Juan Weather Bureau, and repeated every four hours.

YUGO-SLAVIA.

Transmitting Station: Belgrade, HFB.

Wavelength: 6500 C.W. Position 44° 48′ N.; 20° 22′ E.

A weather bulletin is issued daily at 1345 G.M.T.

NATIONAL RÉSUMÉS
OF THE TECHNICAL PROGRESS OF RADIOTELEGRAPHY AND RADIOTELEPHONY IN VARIOUS COUNTRIES DURING 1921

AUSTRALIA.

THE existing wireless services of Australia are catered for by four distinct organisations. The coastal service for communication with ships at sea is carried on by a branch of the Postmaster-General's Department; manufacturing for all services and the conduct of Wireless Service in merchant ships by Amalgamated Wireless (Australasia), Limited; Naval services, ship and ashore, are under the direction of the Naval Board, and Military Aircraft wireless is under control of the Australian Air Force. These four organisations work in close co-operation for the advance and application of wireless.

Control of coast stations and licensing authority for merchant ship and amateur stations was transferred from the Department of the Navy to the Postmaster-General's Department in October, 1919.

The following gives a brief resumé of the progress and development during recent months :—

Administration.—Administration of Wireless Telegraph Act transferred from Minister for the Navy to Postmaster-General.

Wireless Telegraph Act, 1905, modified to include wireless telephony.

Issue of statutory regulations empowering the Minister to issue licenses for experimental stations.

Passing of Commonwealth Navigation Act, including provision for compulsory equipment with wireless to all merchant vessels of 1,000 tons and greater, and all ships (irrespective to size) licensed to carry twelve or more passengers.

(*N.B.*—A recent decision of the High Court excludes all vessels not trading beyond the borders of one state on the ground that the Commonwealth has no jurisdiction over purely intra-state vessels.)

Commercial.—All shipowners using wireless in Australian ships purchased shares in Amalgamated Wireless (Australasia), Limited, thus establishing a co-operative company with shipowners' representatives on the board.

Discussions are proceeding between the Government and the Almagamated Wireless (Australasia), Limited, on the question of establishing a direct commercial service between Australia and England.

Proposals for a direct service are favoured by the Government and the Press.

Constructions.—Manufacture of electronic valves successfully introduced by the Amalgamated Wireless (Australasia), Limited, That Company also designed a complete range of wireless telegraph and wireless telephone stations for inland communication and for inter-island communication, and completed a specially designed equipment approved by the Steamship-owners Association for merchant ships coming under the Navigation Act.

The Postmaster-General's Department are erecting a continuous wave station at Powells River in the Northern territory for communication with private station owners.

The installation of medium power arc stations has been completed at Sydney, Perth and Townsville.

Development.—Wireless telephone experiments have been conducted over various distances by Royal Australian Naval Radio Service, Amalgamated Wireless (Australasia) Limited, and Postmaster-General's Department, and a demonstration of radiotelephony and a short address on Wireless were given by the writer before all members of the Senate and House of Representatives and their friends in Queen's Hall, Federal Parliament House, Melbourne.

A new experimental station especially equipped for long distance reception has been established by the Amalgamated Wireless (Australasia), Limited, at Koo-wee-rup, in Victoria. This station can now receive direct from England, France, Germany and the Atlantic Coast of America, during most hours of the day.

E. T. Fisk.

CANADA.

IN the light of modern advancement in radio communication, the year 1921 witnessed the re-organisation of the various groups of coast stations owned by the Government of Canada, both on the Atlantic Coast and on the Pacific Coast. On the Atlantic the apparatus in several stations has been improved in line with present day requirements, whilst the stations at Cape Ray, Heath Point, Pictou and Partridge Island, erected in the early days of Radio, before the coherer had yet been discarded, were closed.

When Harrington Station has been so equipped as to afford efficient communication between Grindstone and Belle Isle, it is likely that the stations at Port Amour and Point Riche will also be closed.

The Montreal station has been transferred to a more suitable site where it now forms a reliable connecting link between the Great Lakes and the sea, communicating with Kingston on the one side, and Quebec on the other. Three Rivers, lying between Montreal and Quebec, has thus become redundant and will be closed shortly.

In order that local weather conditions in that vicinity may continue to be furnished to vessels requiring them, the lightship at Heath Point will be equipped with apparatus to replace this service, which was formally rendered by the Coast Station at Heath Point, just closed.

The fourth Direction Finding Station on the East Coast has been erected and placed in commission at Red Head near St. John, N.B. In addition to giving ships their bearings on 800 metres, it also undertakes on 600 metres the commercial traffic formerly handled by the Partridge Island station.

On the West Coast the stations at Ikeda Head and Pachena Point have been closed down, and the work of installing a new 20 kW spark equipment at Estevan for improved communication with transpacific ships is rapidly progressing.

Triangle Island station has been transferred to a more accessable place at Bull Harbour, on Vancouver Island.

Albert Bay and Point Grey have been fitted with C.W. apparatus to facilitate the dispatch, without interference to ship work, of inter-station traffic along the coast of British Columbia; Albert Bay, particularly, acting as a central point for handling traffic to and from private stations erected at lumber camps and canneries situate at isolated points not served by land telegraphs.

Stations have been erected at Dartmouth, N.S., High River, Alberta, and Jericho Beach, near Vancouver, for communication with aircraft. High

River and Jericho Beach were used extensively during the past two seasons as bases for communication with aircraft engaged in Forest Fire patrol work.

The discovery of oil in that vast northern territory known as the MacKenzie River Region, hitherto reached only by canoe and Indian Trail, has brought to the fore the necessity of rapid communication, and licenses for the erection of three C.W. Stations at Edmonton, Fort Smith and Fort Norman, have been granted.

The Marconi Wireless Telegraph Company of Canada reports a busy year, and several notable improvements at its stations, particularly at Glace Bay. The year's close will see work on a new experimental station near Montreal well advanced, and in 1922 is expected to bring developments which will mean a great deal to the Canadian Company and to Canada.

In every branch of the Canadian Company's business there has been activity, and this in spite of the adverse commercial conditions prevailing. The changes at Glace Bay and Louisburg make the transatlantic circuit thoroughly up to date, and complete the work commenced with this object by the Marconi Company at Clifden. New equipment includes 24 " MT6 " valves, handling about 2 kW each, and also an earth screen. The aerial resistance has been reduced considerably with the result that the original aerial current is now obtained with one-fifth of the original power input. Louisburg receiving station has been equipped with new superfine " note " tuning gear and auto-recording apparatus in connection with an Undulator relay. The Company's 6 kW continuous wave press-station at Glace Bay, designed for the purpose of transmitting press bulletins to ships on the Atlantic, is operating successfully. Automatic transmission is controlled at Louisburg, and press is sent at 10 p.m., Eastern Standard Time, on a wave-length of 2,800 metres. At La Prairie, near Montreal, a 15 kW experimental station is under construction. Most modern equipment is being installed, and the Canadian Marconi Company states that the work which is being untaken at this point will result in several distinct advances in present methods of handling telegraph traffic. Before commencing construction work at La Prairie, the Company conducted a series of experiments extending over a period of four months.

The use of Marconi wireless telephone apparatus in connection with forestry patrol work is very favourably reported upon by the Department of Lands officials at Vancouver. Marine equipment has been considerably improved.

The growth of amateur radio activity during the past year has been phenomenal. The Company's schools have been conducting special courses to meet the demand for construction suitable for amateur requirements. June saw the birth of Canada's first all-radio publication, *Canadian Wireless*, a monthly magazine devoted exclusively to professional and amateur wireless within the Dominion. While the magazine is published by the Marconi Company, every effort is made to insure its being truly representative of Canadian wireless interests generally.

PROF. A. S. EVE,
McGill University, Montreal.

CHINA.

DURING the last year progress from the technical point of view has been somewhat disappointing, but the want of progress is more apparent than real, for the reason that one cannot judge a nation like China from the same standpoint as one would Western countries. The Chinese are interested in radiotelegraphy, and from their point of view have

made rapid progress since the European War of 1914-1918. The majority of people who are not familiar with China are unable to realise the immense distances and the difficulties of transportation, hence when it is reported that a station is under construction, they are surprised at the time which elapses before the station is completed.

The 25 kW arc station at Urga (the capital of Mongolia) stated to be under construction in last year's issue, was completed in February, 1921, and was taken over by the Board of Communications. It was in communication with Peking, a distance of 800 miles, for three weeks, when the city was attacked by Mongols, and the station put out of action. It is expected to be in working order again in about six months time. The two stations to be erected at Urumsti and Kashgar, in Eastern Turkestan, are under construction. These two stations are typical examples showing the difficulties of transportation. Urumsti is 1,500 miles from the nearest railway, and Kashgar nearly 3,000 miles, the only means of transport being by camel. The country in 1921 was in a very unsettled state, and safe transport to these two cities was not possible, but in spite of this it is expected that the two stations will be completed towards the end of 1922.

The Chinese National Wireless Telegraph Company, a joint concern of the Chinese Government and Marconi's Wireless Telegraph Company of London, has made considerable progress, but here again one must remember the difficulties to be encountered. Most of the year has been taken up with consolidating the company's position, and explaining the possibilities to the Chinese authorities and business men.

A factory has been built at Shanghai, and machinery is now being installed; it should be ready to manufacture wireless apparatus in the course of the next few months.

The National Research and Testing Laboratory, instituted by the Board of Communications is nearing completion, and a monthly periodical has been started by the students connected with radiotelegraphy.

The six students sent to the Marconi College, at Chelmsford, by the Board of Communications have now returned to China, after passing through a two years' course of instruction. It is expected that they will be a great help in the development of wireless in their own country. The four students sent to the same College by the Board of Navy are also on their way back to China. It is intended that they shall deal with coast and ship radiotelegraphy.

The Wireless Telephone Signal Corps, formed by the Board of War in 1919, is now an established service in the Chinese Army with a complement of 400 officers and men; at the present moment there are 50 Field Wireless Telephone Sets in use in the various armies, from Manchuria to Honan. The fact that all these sets are worked and maintained without any foreign supervision, would go to prove that the Chinese really are interested, and wish to go ahead with radiotelegraphy.

New stations under consideration are to be erected at Harbin, Peking, Canton, and a large transpacific station at Shanghai. These stations will come under the control of the Board of Communications.

Quite a number of people look upon radiotelegraphy as being too new a science for the Chinese, but if it is remembered that landline telegraphy and telephony are both established services in China, the telegraph service being quite as reliable, and perhaps better than that in some western countries, the writer can see no reason why a radiotelegraph service cannot be established and operated in a successful and efficient manner, so as to become a financial asset to the Government.

F. E. Robinson.

FRANCE.

SINCE the beginning of the year the radio activities in France have been concentrated almost entirely on the realisation of the super-powerful Paris Radio Centre which is being erected on the site of the former estate of Sainte Assise, some forty kilometres south-east of the capital.

This installation will comprise three transmitting plants, one of which will be used for inter-continental communications, another for continental traffic, and the third to perform the services with London and Madrid.

The inter-continental station will be fitted with two 500 kW and two 250 kW Latour—S.F.R. high-frequency alternators arranged for independent or combined working. The direct current motors driving these high-frequency alternators will normally be fed off the power supply transformer groups, but in case of failure of the latter three auxiliary generators, each driven by a 1,800 horse-power Diesel engine, are provided. The antenna is of the "**T**" type, and is made up of twenty parallel conductors supported by sixteen steel towers of the lattice type, each having a height of 250 metres (approximately 800 feet) covering an area of nearly one million square metres. Each tower will rest on a concrete block having a volume of 50 cubic metres, and weighing about 120 tons. The staying of each tower will be done by 28 steel ropes of unequal lengths, the largest being capable of resisting a pull of 106 tons. The author's " balanced multiple-earth " system will be used in this installation, and will be made up entirely of copper plates and conductors, which will spread over an area approximating two million square metres. A total length of 175 kilometres of wire will be used up for this station only. For multiplex working, each half of the antenna will work independently, and Bethenod's compensating system will be used to overcome the mutual reaction between the two halves. Signalling is carried out by removing the normal short-circuit of the alternator. This method is particularly suitable, as it considerably reduces the " spacing " power consumption of the machine. The alternator speed is maintained constant by an extremely sensitive regulator by means of which the wavelength variation does not exceed 10 metres when transmitting on a wavelength of 10,000 metres. This slight variation of wavelength is hardly perceptible at the receiving station, even with very sensitive and selective apparatus. With a view to adjusting the alternator constants to those of the antenna, which latter can only be calculated approximately, the alternators are inductively coupled to the antenna through a high-frequency transformer of variable ratio so that it is possible to work the alternators under optimum conditions. By parallelling the four alternators of this station, it will be possible to put 1,500 kW into the antenna when working simplex.

The continental station will be fitted with four 25 kW Latour—S.F.R. high-frequency alternators which may also be coupled in parallel if required. These alternators may be regulated so as to produce frequencies comprised between 26,000 and 32,400 cycles per second, without exceeding a peripheral speed of 150 metres per second. The antenna of this station is of the double umbrella type, and will be supported by a single lattice tower having a height equal to those of the inter-continental station. As in the latter station, arrangements are provided for the independent utilisation of either portion of the antenna for multiplex working.

The third transmitting plant has been working satisfactorily with London and Madrid for some time. This station differs from the two previously described inasmuch as it uses three-electrode valve generators instead of high-frequency alternators. Its antenna is supported by a single tower 100 metres high.

All signalling will actually be carried out in Paris, and a seven-pair cable linking the plant with the Radio-France Syndicate's head offices in Paris will handle all the signalling currents.

It is estimated that the three transmitting stations which will normally use automatic transmission will be capable of handling 24,000 words of traffic per hour.

The receiving centre is situated at Villecresnes, in the department of Seine-et-Oise, some twenty kilometres from Paris. It is characterised by a symmetrical arrangement of a number of unattended receiving stations, the whole of which presents the aspect of a series of small watch-towers. Each of these stations will be allotted to reception from a particular station, and will include a small indoor loop antenna orientated in a fixed direction. Several stages of high and low frequency amplification will permit of the incoming signals being relayed on to Paris where they will be recorded automatically.

The end of the year will see the completion of this installation, which will provide France with an adequate and independent means of communication with every country in the world.

MARIUS LATOUR.

GERMANY.

IN the construction of long distance radio stations an efficiency of 72 per cent. has been attained by appropriate connections of the alternator and frequency doubling circuits when a fourfold step-up of frequency is used. The methods of multiplying the frequency without intermediate steps have been much improved, and are now in practical operation. When a high-frequency alternator of 6,000 cycles is employed an overall efficiency of 35 per cent. is attained when the frequency step-up is 5 to 1, and 30 per cent. when it is 13 to 1. The speed regulation of the alternator has attained an accuracy of 1 per cent., which is sufficient for all practical purposes even when using a double heterodyne and note tuning at the receiver.

For the speed regulation the current generated by the high-frequency alternator affects the plate circuits of two thermionic valves connected to a tuned condenser circuit. Relays in the anode circuits are connected to the choking coil in circuit with the driving motor.

The Nauen station which has only recently been enlarged does not even now meet the demands upon it, so that its size is being once more increased. Seven new towers, 210 metres high, will be erected in an ellipse round the station at a distance of about 500 metres from the present 250 metre towers. By this means the geometric mean height of the antenna will be raised from 130 metres to about 190 metres. This new arrangement utilises the highest towers more effectively because at least three wires extend from each tower in three different directions. The antenna is built up of triangular shaped sections so arranged that each part can be lowered independently. All the sections can be connected in parallel and then give a capacity of 90,000 centimetres. This arrangement is to be employed when atmospheric conditions are unfavourable. For ordinary use the antenna is divided into three or four separate antennæ, each of which can be connected to a separate transmitter. The two largest sections of the antenna are each connected with a long wave 400 kW transmitter, both alternators having nearly the same wavelength (12,600 metres and 13,000 metres respectively), differing only sufficiently to enable them to be distinguished at the receiver. The smaller sections are connected to short wave transmitters. Although each antenna section is close to the others it has been found possible to electrically separate them sufficiently to enable them to be operated quite independently.

Further progress will be made at this station by improving the earth connections. After a number of experiments with model antennæ one twentieth of the size of the actual antenna, an earth resistance of less than one-tenth of an ohm has been attained. If Abraham's theory with regard

to the proportions of model antennæ holds good, an almost immeasurably small earth resistance may be expected for the new antenna.

Abraham's theory with regard to model antennæ states that if all the dimensions of the antenna are equally enlarged, the earth resistance decreases proportionally to the increase in size assuming that the conditions of the ground connections are such as to take the earth current as far as possible outside the area covered by the antennæ. More than half of the lines of force from the antenna enter the ground outside the area of the antenna, when, as in this case, the antenna has a radius of 500 metres, and is 200 metres in height. Hence the mean flux line enters the ground on the border of the projected area of the antenna. The earth connections must therefore be made at this place. About 30 leads are taken from the centre of the antenna and led down to the ground connections which are spread over a space equal to the area of the antenna plus its height. Each one of these earth connections carries only the current corresponding to the number of lines of force which enter the ground in the area covered by that earth connection.

The present resistance of the aerial circuit is 2·3 ohms, but by the above improvements it may be possible to reduce this to 0·7 or 0·8 ohm if the radiation resistance is 0·3 ohm, and the loading coil resistance 0·3 to 0·4 ohm at a wavelength of 12,600 metres. As the aerial will be designed to operate at any voltage up to 120,000 volts, its transmission factor will then be 180,000 metre-amperes. Using such a transmitter energy Nauen will, during the next few years, be able to communicate with Argentina. With this in view a high-power station is now being built near Buenos Aires using a 400 kW high-frequency alternator. This station will have six towers 210 metres high. In order to increase the output of thermionic valve transmitters, higher supply voltages are being used. Large valves of 4 and 5 kW have proved successful. With the early patterns of these large valve transmitters the sound at the receiver was not steady, but this has now been improved. The number of valve transmitting stations used for the Postal Telegraph Service has been increased during the past year, and amongst others a service between London and Berlin has been opened. Many successful experiments have been carried out with wireless telephony for communication between Berlin and other large stations outside Germany. Experiments to test the range of transmission have shown that telephony from a 10 kW transmitter at Königswusterhausen, near Berlin, could be heard 3,000 kilometres from the station, and a small high-frequency alternator transmitter at Nauen (type 150 MK) up to 4,500 kilometres range.

Several new high-frequency wire telephone installations have been made during the past year, amongst these services between Munich and Frankfurt a/M and between Berlin and Hamburg may be mentioned. These permit of four simultaneous conversations between the points in question. It is proposed to lay cables between the large towns in order to overcome the disadvantages attached to the use of overhead lines.

DR. ING. A. MEISSNER.

GREAT BRITAIN.

THE period of intensive radio research for war purposes being ended, the year under survey may be regarded as practically normal and typical of what we may expect in the post-war period. The war has, however, left us a valuable legacy in that the Government is now more firmly convinced of the Imperial value of wireless communication, and of the necessity of keeping wireless research fully alive in all the three Services. This conviction found expression in the formation of the Imperial Wireless Telegraphy Committee, and the Radio Research Board somewhat more than a year ago.

The outstanding event of the year is undoubtedly the opening of the Leafield station, which is to be the first link in the Imperial Wireless Chain. The Leafield station was begun by the Marconi Company in 1913, and taken over incomplete, by the Post Office when the Marconi contract was cancelled. The task of completing it was put in hand in 1919, with the result that the first messages were sent out on August 18th, 1921, being clearly received by stations as far distant as Aden, Newfoundland, and Jamaica. The transmitter is an Elwell-Poulsen Arc, and is intended to have a day and night range of 2,000 miles, and to communicate comfortably with the station of Abu Zabal, near Cairo. The Leafield station is the first high-power station to be designed by the British Post Office.

During the year much progress has been made in the testing of the reliability of various direction-finding sets. From these experiments we may take it as definitely proved that for long ranges atmospheric conditions may produce errors in bearing much larger than the possible errors of observation. It is thus clear that work of this nature is going to give us valuable information regarding atmospheric ionization, rather than to lead to the evolution of a very accurate position finder. In this connection we might notice particularly the strikingly original work of Eckersley on the effect of the Heaviside Layer on the apparent direction of electromagnetic waves. Eckersley assumes that the reason a loop can receive signals from a transmitting station when the plane of the loop is at right angles to the line joining the two stations, is that there is a ray of sufficient intensity reflected from the Heaviside Layer in a vertical plane. His experiments are interpreted as proving that there is definitely a ray reflected by night and not by day, and that it is of the right order of magnitude to produce the effects observed. The point of view is undoubtedly suggestive, and in the near future we may expect important results from experiments designed to test Eckersley's theory in other ways.

The problem of atmospherics is still with us, and although the definite recognition of the identity of most strays with the electromagnetic pulses generated by lightning flashes helps us somewhat in speculating as to the temporal variation of the electric vector of the former, progress at present appears only possible in attempts to increase the ratio of signal to stray. Complete elimination would appear to be, in the present state of our knowledge, a singularly elusive performance.

In this connection it may be mentioned that for an atmospheric pulse of given duration there is a definite receiver frequency for which, *ceteris paribus*, the rectified quantity of electricity passing through the telephones will be a maximum. This follows from the solution of the differential equation expressing the action of an aperiodic pulse on an ordinary antenna system. From this one may deduce the fact that up to a wavelength of 18,000 to 20,000 metres the effect of an atmospheric will increase with increase of wavelength of the receiver. Recognising this, the question of the optimum wavelength for wireless transmission has again been raised by L. B. Turner, who suggests that for ranges such as 4,000 kilometres much shorter waves should be used than are usually adopted, provided the necessary power can be developed at such wavelengths.

In the development of receiving triodes no particularly important advance has been made. In the case of transmitting power triodes makers are gradually realising the usefulness of silica as opposed to glass. Since the melting point of silica is high, the distance between the anode and the silica container need not be large, and thus a small tube is the result. Also the insulating properties of silica are all that can be desired. It thus looks as if we shall soon witness the production of a power triode as satisfactory for the work of transmission as is the small triode for receiving purposes.

E. V. Appleton, M.A., M.Sc.

HOLLAND.

IN the 1920 issue of this YEAR-BOOK mention was made of the linking up by means of wireless telegraphy of Holland with her East Indian Colonies, and some particulars were given about the Indian transmitting station. Since then a large new arc transmitter is being constructed under the direction of Dr. de Groot which is expected to deliver 1,200 to 1,800 kilowatts to the antenna. The necessary primary D.C. input to this arc is estimated to be 2,400 to 3,600 kilowatts. The motor generators have, however, not yet been installed, so that the traffic from India to Holland is at the moment still carried on by means of the smaller apparatus.

The receiving station at this end of the link has been working already for some time, but the transmitting station in Holland which is also being built by the Telefunken Company, has at the moment of writing (October, 1921) not yet been completed. The results of the first tests, which it is hoped can be carried out before long, are, it will be obvious, looked forward to with much interest.

Apart from the work done in connection with the East Indian scheme, no outstanding technical wireless events can be reported to have taken place in Holland during the last year. Mention may be made, however, of a powerful wireless telephony transmitting plant which was installed by the "Nederlandsche Seintoestellen Fabriek" in the Amsterdam Bank, and which is used for the daily transmission of financial news. Further, several types of wireless apparatus are manufactured in Holland by various firms mainly for the use of amateurs, among which the "Nederlandsche Radio-Industrie" is well known in England through its weekly wireless telephone concerts.

We now turn to the purely scientific progress made recently in Holland in connection with the many physical and mathematical problems which are at the base of all industrial applications.

In the Dutch scientific journal *Physica* (Founded April, 1921) an interesting communication appeared by Elias, Julius and Reiseger, about the radiometric measurement of low gas pressures, which kind of measurements, after the advent of triodes, now belong to the domain of wireless. It is there found theoretically and confirmed experimentally that the reflection of a pair of small mica plates suspended by means of a quartz fibre, while a beam of light of constant intensity fell on one of these plates, was, for a certain range of gas pressures, exactly proportional to these pressures.

In a series of lectures given at the Leiden University (1920) Professor Lorentz treated the theory of free triode vibrations. Up to that time, in all theoretical investigations of this kind the triode, characteristics were mathematically considered to be straight lines resulting in a considerable simplification of the analysis. In these lectures, however, an oscillation theory was worked out on the basis of non-linear characteristics, and in this way only it is possible to arrive mathematically at the steady or maximum value of the oscillation amplitudes.

Subsequently, similar investigations were taken up by the present writer, and in a paper read before the "Nederlandsch Radio Genootschap" (Dutch Radio Institute),* it is shown how far a general form of the characteristic triode surfaces the amplitude to which free and forced vibrations build up can be calculated. It is further shown that for a small impressed E.M.F. the system can, under certain circumstances, be treated as having a reduced natural damping, while for a big impressed E.M.F. the resulting amplitudes are proportional to the cube root of this E.M.F., the system thus acting as a limiter.

In another joint paper with E. V. Appleton,† "On the Form of Free

* *Tydschrift van het Nederlandsch Radio Genootschap* 1, pp. 3-31, October, 1920; also *Radio Review*, 1, pp. 701-710, November, and pp. 754-762, December, 1920.
† *Philosophical Magazine* 42, pp. 201-220, August, 1921.

Triode vibrations," the wave form of the anode and grid currents are discussed in detail. When the frequency is very low (*e.g.*, 16 per sec.), some oscillograms show a distinct variation in mean temperature of the filament, the latter being cooled, due to the loss of energy accompanying the emission of electrons. This effect is in ordinary receiving triodes not counterbalanced by the Joulean heating effect of the anode current when it returns to the filament again. The secondary emission by the anode is further found to be an important factor in determining the current wave form ; *e.g.*, the oscillating grid current can be split up in two parts, one part being constituted by the primary electrons from the filament, while the other part is made up of secondary electrons coming from the anode, the latter part often being much the greater of the two during a certain part of the cycle.

In another joint paper with E. V. Appleton*, the conditions for the starting and stopping of triode oscillations is investigated theoretically and experimentally. It is found that these conditions are in general not identical, and thus a kind of oscillation hysteresis is found to occur at the bottom part and top part of the ordinary anode current-grid potential characteristic. The non-linear theory here again gives the explanation. It appeared that the *seventh* differential coefficient of the "oscillation characteristic" has to be taken into account in order to explain the experimental results satisfactorily.

Finally, another application of the non-linear treatment of triode vibrations was given by the writer to the phenomena† occurring when a triode oscillator is coupled strongly to a secondary oscillatory circuit, which phenomena are called in Germany "ziehen." Under circumstances it is found that the oscillations, when one of the electrical parameters is varied continuously, jump discontinuously from one frequency to another. The theory shows that here again a kind of oscillation hysteresis presents itself, and that it is necessary to distinguish the oscillations as stable, metastable and unstable ones.

There is no doubt that progress in elucidating the many interesting properties of free and forced triode vibrations can only be made on the basis of a non-linear theory. The fact, for example, that forced vibrations can either suppress or start the free vibrations of a triode oscillator can only be explained when the interaction of simultaneous vibrations is taken into account, for in such a case a linear theory, in which the principal of superposition is valid, would be inadequate.

BALTH. VAN DER POL, JUN., D.Sc.

ITALY.

SUBSTANTIAL progress in the development of radiotelegraphic activities in Italy has been made during the past twelve months.

The principal points of progression will be found set out below, and it only remains for us to observe that we should have had still further advancement to report had it not been for the following reasons :—

(1) The strained economic situation for which the war is responsible has prevented the investment of the capital required for extensive development of the latest improvements in this sphere of industry.

(2) We still lack a strong national industrial organisation in the radiotelegraphic field, capable of supplementing the work of the State, on the same lines as in other countries.

(3) The rate of progress has necessarily been limited by the time taken up in legislation, but it is satisfactory to note how much has been achieved in spite of this fact.

* *Philosophical Magazine* 43, pp 177-193, January 1922.

† *Tydschrift van het Nederlandsch Radio Genootschap.*

Manufacture of Apparatus.

At the Navy Works at Spezzia, activities mainly continue to be concentrated on the production of arc sets, but there has recently been a decided tendency to devote more attention to Marconi valve instruments.

At the Army Works at Rome, the material employed during the war has been overhauled, and a start has been made with the construction of C.W. apparatus, for military purposes, in connection with both telegraphy and telephony.

At the Marconi Works at Genoa (the only industrial wireless works erected during the war) considerable attention has been given to the production of valve sets in addition to the ordinary rotary spark apparatus so largely employed in the Mercantile Marine.

In the same factory there have also been produced a number of adaptor sets following the designs originated by the English Marconi Company. These devices admit of the rectification of the alternating feed current of the Marconi rotary spark sets, and are so arranged that the same generator operates both the valve and spark installations. Very successful results have been obtained on board H.M.S. "Trinacria" by the employment of apparatus of this description, with a capacity of 1.5 kilowatts.

During a demonstration cruise carried out by this vessel, it was found possible to communicate regularly with the Rome station from any part of the Mediterranean Sea as well as from the western coasts of Europe and Africa. It has been decided, as the result of these experiments, to fit these sets on the larger vessels of the Mercantile Marine and to equip the coast stations of the Italian Navy, located at Genoa and Adalia (Asia Minor), with similar apparatus. A Select Committee is also considering the question of their adoption for the use by the Army.

The Wireless Institute of Military Engineers in Rome is continuing investigations into the efficiency of the different types of portable and fixed apparatus, and despite the advantages presented by the rotary and quenched spark systems for field station work, the possibilities of valves have come in for their full share of attention. The above institute has also carried out a series of investigations into the technical and scientific effect of electric oscillations, and has continued the good work of organising the staff destined to supervise the activities of army wireless stations.

The Wireless Telegraphic Naval Institute in Leghorn has continued the work of improving and completing its research laboratory. Important scientific results in the analysis of thermionic valve working have been obtained, and much progress has been made in the methods of testing wireless apparatus of Italian and foreign manufacture.

The Ministry of Marine have extended their long distance wireless services (fitted in record time during the war) connecting Rome with the Colonial Stations and Italy with the principal European and American radio centres.

In view of recent developments in long distance wireless the Ministry of Marine has decided to replace the present Marconi station at Coltano (near Pisa), which has proved so successful during the last ten years, by a new and powerful station developing 200 kilowatts. This new station will be supplied with a Marconi valve receiving apparatus (duplex system) and with a high-frequency alternator transmitter supplied also by the Marconi Company.

The fitting of this new station has been decided after exhaustive practical tests made with the arc and alternator system. This comparison took place in 1918 before an official delegate committee of the Italian Navy during their visit to the British station at Carnarvon, when correspondence was exchanged between Carnarvon and American stations having different systems. This new station at Coltano, has now, under Royal Decree, been renamed "Marconi"

and will carry out a direct and regular public service between Italy and America.

The practical use of wireless telephony for public service, made a start in Italy during 1921. After the interesting trials made in the presence of the Italian Press, between the Marconi station at Chelmsford (England) and the Rome station, the utilisation of this new means of communication has been extended in Italy, not only between ships at sea, but also between the Continent, the Islands, and the Italian Colonies.

The Ministry of Posts and Telegraphs, with the technical co-operation of the Ministry of Marine, has opened a radiotelephonic service between Rome and the Island of Sardinia.

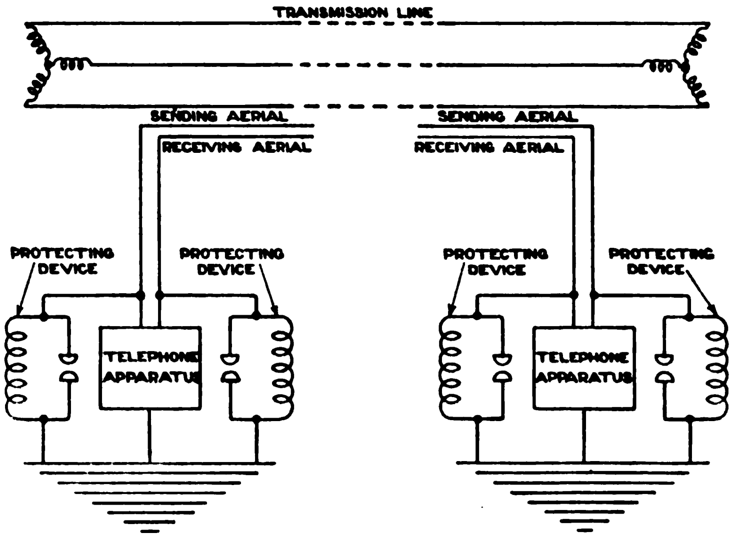
The direction finder was born in Italy, and its modern developments, based on the Artom-Bellini-Tosi Patents, of priceless service to the Allies during the war, reached Italy last year. The installation of these devices is extending, not only in the Italian Navy, but also in the Mercantile Marine.

Senatore Marconi carried out, during 1921, along the European coasts, on board his yacht " Elettra," a series of highly important experiments with a new receiver of exceptional sensitiveness and selectiveness. By such apparatus joined to a square frame of about one metre wide, fitted inside a cabin on board, Senatore Marconi demonstrated to the highest authorities of Italy, Spain, and Portugal, the possibility of receiving messages regularly from America or from any other European station, under the worst atmospheric conditions. The results obtained on the " Elettra" by this new receiver, in respect of which much credit must be given to Monsieur G. R. Mathieu, have proved its absolute superiority to all the receivers at present in use.

The Italian Marconi Company (Società Italiana peri servizi radiotelegrafici), of which Senatore Marconi is the chairman, was formed in July, 1921, and has started the installation of a wired wireless system of wireless telephony, in order to join up the hydroelectric power stations with the large centres of distribution of electrical energy.

JAPAN.

THE technical progress of radio in Japan during last year relates essentially to the following items :—



(1) High Frequency Telephony over Power Transmission Lines.
(2) Radiotelephony for Short Distance Communication.
(3) Opening of a High Power Radiotelegraphic Station.

As to the application of high-frequency telephony over power transmission lines, the field experiment at the Kinugawa Hydro-Electric Company, which was referred to in the last YEAR-BOOK by myself, popularised interest in this art among electric power engineers in this country. Cabinet sets of new design for commercial use were manufactured, and with them have been executed further field tests on the transmission lines of the Ujigawa Electric Company. The skeleton diagram of the arrangement is seen in the accompanying figure, and was patented in November, 1921, in this country.

The recent development of power triodes in this country has induced us to carry out radiotelephonic experiments over moderate distances. The test between Awomori and Hakodate, which was also referred to in the last YEAR-BOOK, is one of them. Though the results of the test have been quite satisfactory, using only a small power tube for the transmitter, the spark radiotelegraphic communication, which has been handled incessantly between the same stations, made the continuous radiotelephonic connection impossible. The steps are being taken to make possible the simultaneous working of radiotelegraphic and radiotelephonic channels, the spark system being replaced by a continuous wave one. Two other places which require radio connection

are Japan proper and Korea. Their shortest distance over sea is about 120 nautical miles. This will be experimented with in the near future.

I think, under the present condition of technical advancement, it is very difficult for a person without electrical knowledge to easily handle even the simplest radiotelephonic apparatus. It must therefore be remembered that,

for wide use of radiotelephony, the connection of wired and wireless telephones is of vital importance, and this art must make progress in parallel with that of radiotelephony itself.

As a record of transpacific communication a high power radiotelegraphic station called "Iwaki" was opened in March, 1921. The transmitting and the receiving houses are about 20 miles apart, and some 170 miles north of the City of Tokyo. The transmitter consists of a 400 kW arc converter and a 400 kW 20,000 cycle alternator, either of which may be spare. The aerial is of the umbrella type, and is supported by one main tower 200 metres high and 18 wooden poles 60 metres high, surrounding the former as the centre of a circle. The centre main tower is of the self-supported type, and is a reinforced concrete structure weighing about 11,000 tons. The total construction cost of the whole station, including both transmitting and receiving sections, amounted to about 1,000,000 yen. Though, at present, this station is limited to the duplex daily communications with the Kahuku and Koko Head stations of the Radio Corporation of America, in Hawaii, it is intended to extend it to direct traffic with European stations, if the station capacity is sufficient.

EITARO YOKOYAMA.
Superintendent of Radio Section, Electrotechnical Labratory, Japan.

NEW ZEALAND.

THE only recent developments in New Zealand are the fitting up of merchant ships and the passing of an Act authorising the Postmaster-General to issue licenses for experimental stations.

There are four coast stations in New Zealand owned and operated by the Post and Telegraph Department, and a considerable number of merchant

ship stations owned and operated by the Almalgamated Wireless (Australasia), Limited, under the same co-operative arrangements as exist in Australia, whereby the principal shipowners are shareholders in the Company and have their own representative on its board.

The Government station at Awarua has done much important work in experimental long distance reception, definitely establishing the possibility of receiving direct from high power stations in Europe.

Apart from training schools, there are no other activities in New Zealand, but it is anticipated that a corresponding station will be erected as soon as arrangements are completed for wireless communication between England and Australia.

E. T. FISK.

NORWAY.

NO technical development of any interest has taken place in this country during 1921. Slight improvements have been made in existing land radio stations, but no additional stations have been erected. In the Norwegian Mercantile Marine progress has been made in the fitting of ships with wireless installations and by the end of 1921 about 475 vessels will be so equipped. C.W. apparatus has been introduced on the larger passenger vessels and considerable interest is being evinced in the development and application of D.F. apparatus to marine work.

The general laws and regulations with regard to the control and use of wireless telegraph installations have remained unchanged, as also have the restrictions still imposed upon amateur and experimental wireless work in this country.

Commander B. L. GOTTWALDT.

SPAIN.

THERE has been little or nothing to report about the progress of wireless in Spain during the first half of the year 1921. Lately, however, conditions have changed and some activity has been shown in various quarters.

The Navy Department have decided to modernise all the wireless equipments of the Spanish Navy. All the vessels having spark sets will be provided with valve installations. The development of this scheme has already begun.

A Bill was passed providing the necessary resources for the establishment of the Spanish Naval Aviation Service and the provision of wireless equipment for the Naval Aircraft; the first hydroplane has already been fitted with a Marconi type "AD 2" set and a direction finder, and the fitting of further machines will be carried out very shortly. Furthermore, the fitting of the submarines and their bases with the latest type of valve equipments is now under consideration at the corresponding Naval depôts.

The Government has been compelled to start military operations on a wide scale in Morocco, owing to the last Moorish revolt, and in order to improve the efficiency of the Army, the number of wireless field sets in use has been largely increased. Most, if not all, of the sets have been supplied by the Compañia Nacional de Telegrafia sin Hilos, the licensees of the Marconi patents in Spain. The success obtained with the portable sets that are now working throughout the different branches of the Army has led the Government to call for a "Concourse," in order to determinate the types that will be adopted as standard for the Army. The Aviation Services have been

pushed forward, and a number of flying machines have already been equipped with wireless sets. Permanent stations at Madrid (Cuatro Vientos), Sevilla, Cartagena, and other places, are in course of erection and will be employed to communicate with the flying machines.

The fitting of the wireless telephone and telegraph stations at Valencia and Palma de Mallorca is proceeding satisfactorily, and is very near to completion. Each station will consist of a 1½ kW Marconi Valve "Cabinet" set. Some extensive trials had to be carried out for the selection of the best sites, so as to avoid screening effects and local influences from electric power and tramway lines.

In order to cope with the present requirements of the International Public Wireless Service, the Compañia Nacional de Telegrafia sin Hilos is now developing a scheme embodying important improvements in the working capacity of the Aranjuez (Madrid) and Prat de Llobregat (Barcelona) stations. Each of them has already been provided with a 15 kW valve transmitter of the latest Marconi pattern. Both sets are already working, and the results obtained are very satisfactory. Special receiving stations have been installed at Barcelona and Madrid; the latter is linked by landline to the Aranjuez transmitting station, and a similar scheme for the Prat de Llobregat-Barcelona stations is now under consideration. Use is made of the latest devices in regard to frame aerials and valve receivers, and some special arrangements had to be provided in order to balance out the interference from nearby stations. The work of cutting out jamming has been particularly troublesome at the Madrid station on account of the proximity of the high power Army station of Carabanchel. Owing to the increasing volume of traffic with the United Kingdom and Germany, and the necessity to develop the traffic with France, it has become imperative to employ automatic transmission for the Madrid-Aranjuez station. Therefore, in the very near future, the Aranjuez valve transmitter will be operated from Madrid at high speed by means of a Wheatstone Transmitter and Creed Perforators; the received signals will be recorded by a Marconi Patent Undulator.

The year 1921 has been marked by a great depression of the Mercantile Marine business, owing to the abnormal economical conditions prevailing throughout the world. On the other hand, a Royal Decree was issued on February 19th, stating that as the circumstances that made wireless sets compulsory for all ships had disappeared, only ships carrying more than twelve passengers or more than fifty persons aboard need now be provided with a wireless installation. However, in spite of these unfavourable conditions, wireless sets have been fitted on 25 merchant ships during the year, and the substitution of valve and quenched gap sets for the old spark sets as well as the fitting of direction finders on the larger passenger ships is proceeding satisfactorily.

The position of the wireless amateur in Spain has not improved, as the Post Office authorities are still reluctant to grant licenses for private stations. The Post Office, however, is none the less enthusiastic on wireless, as has been well evidenced by the establishment of a School for Radio Engineers, in order to provide the necessary trained men when the developments contemplated by this department have come into being.

UNITED STATES.

THE past year has witnessed a vigorously healthy development of radio communication in America. This has been particularly evident in the expansion of the long distance field. On the Atlantic Coast, in addition to the high power station of the Navy at Annapolis, there are now 200 kilowatt stations for European communication at Tuckerton (New Jersey), New Brunswick (New Jersey), Marion (Massachusetts), and at Port

Jefferson (Long Island). This last station is the well-known New York Radio Central, and will have an ultimate antenna power running into thousands of kilowatts. It will comprise at least twelve unit transmitting stations for transoceanic working, two of which are already completed. All of the preceding stations are operated by the Radio Corporation of America, which also operates the similar stations at San Francisco, California and Hawaii, on the Japanese circuit. In order to provide these and other stations abroad with generators, several dozen 200 kilowatt Alexanderson alternators have been built during the last year and a half.

The longer distance ship services have also been expanded during the year by the erection of a number of coastal stations by the Federal Telegraph Company (Poulsen arc system), Cutting and Washington, Independent Radio Telegraph Company, International Radio Telegraph Company, and the Radio Corporation of America (vacuum tube system). The Belmar (New Jersey) and Chatham (Massachusetts) stations of the last named company are particularly interesting in that they are directly controlled by wire line from New York, thereby expediting traffic.

The Federal Company is establishing a chain of overland stations using the arc system on the West Coast, and the Intercity Radio Company has established overland stations at New York, Cincinnati, Detroit, and Chicago.

The broadcasting of market reports has engaged the attention of the Bureau of Markets of the Department of Agriculture, and radio is being used widely by the Government for this purpose. The Post Office Department is also using radio for communication with the mail planes.

The use of underground antennas for reception has been investigated by Messrs. A. Hoyt Taylor and A. Crossley, of the Navy. It has been found possible by their use to receive through nearby transmitting stations, utilising the directional effect, and thereby also to establish very effective duplex communication.

The transfer of received radio signals over wire lines to suitable central offices in the larger cities, where they may be transcribed and the messages promptly issued, has engaged considerable attention on the part of the Radio Corporation. It has been possible to carry on actual reception in the heart of New York, while the special static-reducing antenna system and its associated receivers were situated many miles away, with wire line connection to the city.

High speed reception has also advanced considerably recently. The Hoxie photographic recorder has been produced by the General Electric Company, and found certain applications. The Radio Corporation has also produced a new form of high speed ink recorder, which is widely used in their receiving stations.

Among recent receiving methods should be mentioned the double heterodyne system for short wave reception, disclosed by E. H. Armstrong.

The use of the sense of taste for reception was investigated by the author and E. T. Dickey, at the suggestion of A. Isbell. It was found possible to receive to an acceptable extent by this curious method.

Vacuum tube development during the year has been in the direction of standardisation of detector and amplifier receiving tubes, and the low and moderate power transmitting tubes. One exception to this has been the development of the pliodynatron, a special form of four-electrode tube, as an unusually effective detector and amplifier.

The use of radio direction finding has been rapidly expanded by the establishment by the Navy of a chain of radio compass stations which give ship transmitters their position by means of a process of triangulation. The Bureau of Lighthouses has also established a number of unmanned radio beacons, which enable ships equipped with direction finders to determine

their location in a fog by receiving and identifying the signals from several such beacons.

The special aspects of direction finding have been investigated by C. Kinsley, as to changes in the apparent direction of transmitting stations, and by L. W. Austin, on the quantitative relations existing for coil transmitters and receivers.

Radiotelephony has been developed along lines of multiplex operation and also in the marine field. Messrs. Ryan, Tolmie, and Bach, have succeeded in transmitting five radiotelephone messages from one antenna simultaneously, on different wavelengths. The American Telephone and Telegraph Company and Western Electric Company have achieved the remarkable feat of transmitting speech from the Catiline Islands in the Pacific Ocean by radio to land, thence by wire across the entire continent, and thence by radio again to the steamship "Gloucester" in the Atlantic Ocean. Speech has also been transmitted from Havana, Cuba, over the submarine telephone cable, and thence by wire and radio to the Catiline Islands.

The introduction of the "wave antenna" for long distance reception by Messrs. H. Beverage and C. Rice has led to a marked improvement in the reception of transoceanic signals through atmospheric disturbances. This long antenna with its associated circuits seems to be highly directional as well. In this connection an interesting practical study of the relative merits of several systems for the reduction of static effects in reception has been carried out by L. W. Austin, and the results published.

During the last year, meetings of the Preliminary International Conference on Electrical Communications were held in Washington. Many of the important and troublesome questions of international radio communication were carefully considered, and it is believed that some progress was made toward satisfactory solutions of these difficulties. The results of this work will be laid before the final International Conference in 1922.

ALFRED N. GOLDSMITH, B.S., Ph.D.
(*Editor of "Proceedings of the Institute of Radio Engineers."*)

THE RECORDING OF WIRELESS SIGNALS.

By Prof. HENRI ABRAHAM and EUGÈNE BLOCH.

INTRODUCTION.

THE development of methods of reception of wireless signals has followed quite different lines from ordinary telegraphy. In the latter the transmitted signals were reproduced, first of all, on the tape of a Morse instrument, by degrees the method of recording was perfected and there appeared the Wheatstone apparatus, the apparatus due to Hughes, the apparatus of Baudot, and others besides, which ultimately produced direct on a piece of paper the characters written in the telegram, just like a typewritten copy.

In the case of wireless telegraphy, however, there were three distinct stages of development.

In the first instance, when the coherer was used to detect the waves, the variations in resistance of the receiver were employed to actuate a relay and to record the signals on a Morse tape. The idea in this case was to imitate the methods used in ordinary telegraphy, and no thought was given to the question of the reception of wireless without recording, or, at least, without the employment of a strong electromagnet, as in telegraphic reception with the sounder.

This state of affairs was quickly changed. The employment at the transmitting station of low-frequency spark trains succeeding each other by small fractions of a second during the transmission of each signal, combined with the use of detectors which were practically instantaneous in action (such as galena, and electrolytic or magnetic detectors), made possible the use of the telephone for reception. The replacement of the low-frequency sparks by sparks of musical frequency added so considerably to the efficiency of the telephones that their use became universal and for a long while the recording of signals was abandoned in practical work. Apart from its extreme simplicity, the telephone took advantage also of the extreme sensitivity of the ear, and of its ability to distinguish easily between the musical signals transmitted on a definite note, and noises due to "atmospherics," which, in the telephones, took the form of sudden clicks devoid of any musical characteristic. Reception by sound has therefore become the rule, and there has been no serious reason for discarding it, while the traffic of the wireless stations was not very heavy, and one could be satisfied with a speed of transmission not exceeding one thousand or twelve hundred words an hour.

Nevertheless, since this period, which lasted until towards 1914, very exhaustive experiments have been made in methods of photographic recording of signals by various experimenters in the interests of science. It was by this means, for example, that it was possible to determine the speed of propagation of wireless waves around the earth by recording the signals transmitted by two intercommunicating wireless stations, simultaneously with the vibration of a standard tuning fork. In particular, a series of experiments were conducted between Paris and Washington in 1913-14,* and Fig. 1 is a reproduction of a photographic print obtained at Washington in

* H. Abraham, A. Dufour and G. Ferrié, "Sur une Méthode de Mesure Directe de la Durée de Propagation des ondes de T.S.F. à la surface de la Terre" (*Comptes Rendus de l'Academie des Sciences*, Vol. 159, p. 38, 1914).

See also "Au Sujet de la Détermination de la Différence de Longitude entre les Observatoires de Paris et de Washington" (*Comptes Rendus de l'Academie des Sciences*, Vol. 162, p. 899, 1916).

the reception of the low frequency spark signals ("étincelle ronflée"), which were transmitted by the Eiffel Tower at this period.

The third period of development began about 1913, with the discovery and utilisation of the amplifying properties of the "audions" or three-electrode valves, invented in 1906 by Lee de Forest. These valves having the property of amplifying received signals to a degree hitherto unknown,* it became possible to have sufficient energy at the receiver to actuate mechanical recording instruments of more robust a nature than the photographic galvanometers.

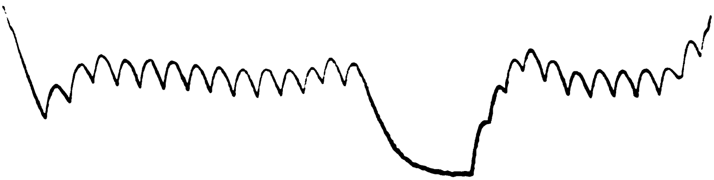


Fig. 1.

Record, taken at Washington, of a transmission from the Eiffel Tower (ronflée), January 13th, 1914.

At the same time that the introduction of these amplifiers produced a veritable revolution in the reception of wireless telegraphy, the transmitting stations, too, were undergoing important changes. In place of the spark transmitters continuous wave transmitters were being gradually introduced, and the signals emitted by them were more readily distinguishable from atmospherics and other interference. The power of the transmitters of the large stations was also much increased so that the seriousness of interference in long distance communication was lessened. But the increase in the cost of construction of the extra high power stations and the cost of maintenance has produced another difficulty. It is necessary to increase their efficiency by exploiting to the utmost their capacity for transmission, or only a ruinous business will result.

In place of hand operation, which cannot exceed 20 words per minute, automatic transmitters are employed which operate up to a speed of 50, 100 or even 200 words a minute. But with this speed of transmission, direct reception by ear by means of the telephone is not possible; the ear can no longer follow the signals, and it has become necessary to revert to methods of recording.

Photographic Methods.

The first practical use of photographic methods in wireless telegraphy is about contemporary with the scientific movement which accompanied the development of time signal services, marked by the holding at Paris, in 1912, of an International Conference, and by the foundation of the Bureau International de l'Heure.

Apart from the commercial reception of messages, a new problem had presented itself. It was the question of determining, with the maximum accuracy possible, the moment of arrival of a wireless signal, for the purpose of the checking of clocks or the determination of differences in longitude; it was, of course, apparent that a photographic record would give more accuracy than would be possible in reception by ear.

* The "amplifying tubes" did not come into practical use until it had been possible to construct them with high vacuum (less than 1/1,000,000 of an atmosphere) as in the construction of X-ray tubes. This was accomplished in 1914 by I. Langmuir, in the United States, and by H. Abraham and G. Biguet, in France. The type developed by the latter was known under the name of "Lampe de la Télégraphie Militaire (T.M.)," or "French Valve," and was reproduced in large numbers during the war; the allied armies employed nearly a million of them.

The following methods were suggested and employed with success * :— String electrometer with single metallic quartz fibre (Wulf), a string galvanometer (Lucas), or the moving coil galvanometer (Abraham). These were not the only experiments, however, and in particular, about this time, there passed through our hands some excellent prints obtained by engineers of the Marconi Company.

A little later we obtained, across the Atlantic, during the winter of 1913-1914, direct records, without amplification, of the Eiffel Tower signals, received at the Arlington Station in the United States, the object being the measurement of the speed of propagation of waves on the surface of the earth, and the determination of the difference in longitude between the Observatories of Paris and Washington.

We employed a moving coil galvanometer placed in the field of an electromagnet. The coil, of very fine wire, was extremely narrow, and was mounted with its length in line with the suspension wire. A tenth of a microampere gave a movement of about one centimetre, and the rapidity with which the coil returned to zero was of the order of the tenth of a second. It was under these circumstances that the print shown in Fig. 1 was obtained, in which the individual reception of successive sparks can be seen, separated by intervals of a twentieth of a second, which corresponds with the old low frequency spark transmissions of Paris. Fig. 2, obtained in the same way, but with a more rapidly acting galvanometer,† shows the simultaneous reception of two telegrams, one from a "musical spark" transmitter, and the other from a "low-frequency" spark. The two transmissions can be easily distinguished, and the low-frequency spark signals are separated from the "musical" signals in the same manner as atmospherics.

The invention of amplifiers has necessitated the reconsideration of the question of photographic recording. With more energy available, less delicate instruments can be employed, giving more rapid action—as, for example, the Blondel oscillographs.

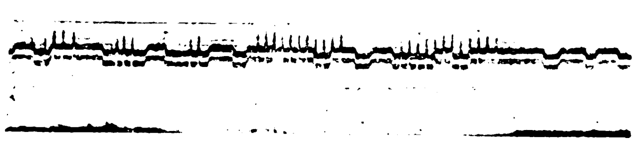

Fig. 2.
Simultaneous photographic reception of two transmissions—one "ronflée" and one musical note.

Mr. Alexanderson, in the United States, set to work from a somewhat different point of view, in proposing the use of a galvanometer tuned to vibrations of high audible frequency (2,000 to 3,000 per second). The apparatus is intended for the reception of continuous wave signals by the beat method. The galvanometer may be described as a "moving-iron" galvanometer. The recording action consists of a little triangle of steel, having the period of vibration already stated, which is brought under the influence of an electromagnet similar to that of a telephone. An ingenious arrangement allows this movable action to control, with amplification, the rotation of a galvanometer mirror. The tuned galvanometer vibrates during the whole time it is excited so that each signal is translated into a broadening of the zero line (Fig. 3).

* Conférence Internationale de l'Heure (1912). Contributions by Messrs. Abraham, Lucas and Wulf. (*Procès verbaux des Séances*, pp. 235, 239 and 243.) See also Turpain (*Journal de Physique*, 1911).

† Unfortunately, this photograph has been taken with too much light, and the print is disfigured by multiple reflections on the two faces of the galvanometer mirror.

The photographic methods which we have just briefly described, have not reached their final stage; they are destined to give still greater service to wireless telegraphy. If they have the disadvantages that chemical products and a dark room have to be employed, they have, nevertheless, the advantage over other methods that they are much more sensitive for the same speed of recording.

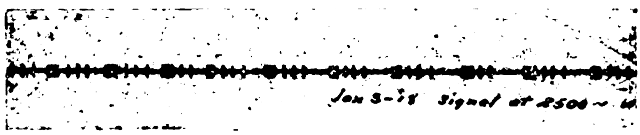

Fig. 3.

Reception of radio signals with an Alexanderson resonance galvanometer.

ACOUSTIC METHODS.

Since good amplifiers have been available it has become possible to receive the most distant transmissions with great intensity, and it has been possible to record on the cylinder of a phonograph the movements of the vibrating diaphragm of the telephone receiver.

In principle, the arrangement is quite simple. The telephone current being amplified so as to produce very powerful sounds the vibrating diaphragm is connected to a sapphire with a cutting edge which traces a groove in the wax cylinder of the phonograph. When once the telegram has been inscribed the apparatus is made to repeat it so that the operator may prepare the transcription.

This method permits of the recording of rapid automatic transmissions which the phonograph afterwards repeats slowly. In this repetition the ear retains its faculty of analysis in spite of the noises produced by the reproduction, so that the operator is able to distinguish quite well between the "timbre" of the signals and the confusion of jamming and atmospherics. But these qualities must be balanced against the disadvantage that is occasioned by the loss of time in double reception and by the necessity of renewal of the wax cylinders without causing interruption of reception, each cylinder serving only for a few minutes, whilst each individual cylinder can only be used again three or four times. Further, in the reception of very rapid transmissions, it is necessary to slow down the speed of the phonograph to such an extent to render the signals readable for transcription, that a drop in tone of one or two octaves will occur thereby rendering it extremely difficult to read the signals.

In spite of these objections, the method of reception by means of the phonograph has rendered, and still is rendering, good service in certain receiving stations.

Experiments have also been conducted in replacing the phonograph recording by magnetic recording, employing the telegraphone due to Poulsen. As is well known, this apparatus consists of a long steel wire passed slowly against the electromagnet of a telephone. Each variation of the current conveys to the steel wire a trace of residual magnetism; and when the wire is again passed through the field of an electromagnet these traces of residual magnetism produce the repetition in another telephone of all the sounds initially produced. In order to efface a record it is only necessary to pass the wire through the field of a rather strong magnet.

These experiments have apparently given interesting results; but we have no information that the results obtained with the telegraphone have resulted in the definite installation of such apparatus.

Special Amplifiers and Relays for Recording in W/T.

The methods of recording which still remain to be described require rather strong currents, of the order of milliamperes, often furnished by special amplifiers, known by the name of "continuous current amplifiers" or "very low frequency amplifiers."*

These two types of apparatus make use of two distinct types of circuit :— In the very low frequency amplifiers the coupling between one stage of amplification and the next is made by means of condensers of large capacity (0·1 to 2 microfarads) so as to obtain a sufficient value for the "Time constant" of the apparatus measured by the product of the values of this capacity and the resistance of the grid leaks. Variable currents which are of shorter duration than this time constant are easily recorded.

In the amplifiers described as "for continuous currents," the connection from the anode of one valve to the grid of the next is made by a battery of cells or accumulators which brings the potential of the grid to the best value for working. This apparatus has no longer any particular time constant, so that it functions equally well for currents of any frequency.

These amplifiers, which are placed after the detector valve of the high or low frequency receiving amplifiers, act in the same manner as a telegraph relay; and one obtains finally, a sufficient strength of impulse to actuate an electromagnet and thus work a mechanical recorder.

Experience has shown us that it is possible to increase the amplification up to the point of saturation of the last valve. The apparatus then functions "all or nothing"—the anode current of the last valve passing alternately from maximum to zero.

This system contributes to a certain extent to the elimination of atmospherics because the feeble atmospheric disturbances do not effect the electromagnet, and some of them, which might have added to the final current have no effect because the signals themselves produce the maximum possible current.

Similar results are obtained by using telegraphic relays, properly so called (moving-coil relays or moving-iron relays), which, actuated by the current from an amplifier, open and close the circuit of the electromagnet of a mechanical recorder.

These relays sometimes introduce errors in reception. Their construction becomes more complicated as the speed of transmission is increased, for they must respond without lag even though the current available to actuate them does not exceed a fraction of a milliampere.

G. Pierce (United States), in 1917, proposed to use as a relay a mercury arc lamp containing a grid and an anode, as in an audion, but feeding the anode with an alternating current of somewhat high frequency. While the grid potential is negative, no current flow takes place in the anode circuit, but when the potential of the grid attains a certain positive value, an arc strikes between the anode and the mercury cathode. The apparatus then rectifies the alternating current in the anode circuit, and a very considerable amount of power becomes available throughout the duration of the wireless signal which has served to render the grid of the apparatus positive.

More recently Messrs. Johnsen and Rahbek (Denmark) have produced a kind of electrostatic relay extremely rapid in action and of great sensitiveness. It appears that this apparatus will be capable of recording wireless signals mechanically at a speed of several hundred words a minute with an expenditure of electrical power of the order of milliwatts; but we have not yet had information regarding any definite employment of the apparatus. The already known principle is utilised of the apparent increase in friction under the influence of a difference of potential. The apparatus consists of a cylinder of agate which is rotated rapidly inside a little band of Prony.

* Henri Abraham and Eugène Bloch. "Amplificateurs de très basse fréquence et oscillographes, à plume; leur application à l'inscription des signaux de T.S.F." (*Revue Générale de l'Electricité*. Vol. 7, pp. 211 and 255, 1920.)

When a difference of potential is established between the stone and the band, the band is dragged and the position of equilibrium changes. A strong tension spring re-establishes the balance when the difference of potential no longer exists.

Recording on Smoked Paper—Undulators—Morse Printing.

Recording on smoked paper was studied by us in 1916 for military telegraphy.* The received currents, rectified and suitably amplified, are passed through a galvanometer apparatus fitted with a tracing point, which inscribes its movements on a moving strip of smoked paper.

Our recording galvanometer, the magneto-oscillograph, constructed by M. Carpentier, is a little four-pole movable iron type of magneto. Under the influence of currents sent into the electromagnets the movable armature turns and moves a light and rigid pen (Fig. 4). The records obtained on the smoked paper are of extreme fineness and the apparatus is robust enough to overcome, without effort, the friction of the pen on the paper. It is possible to retain a sufficient sensitiveness with complete damping by a tension spring on the movable iron, giving a frequency of vibration of less than one-hundredth of a second. The apparatus will thus follow impulses to about a thousandth of a second.

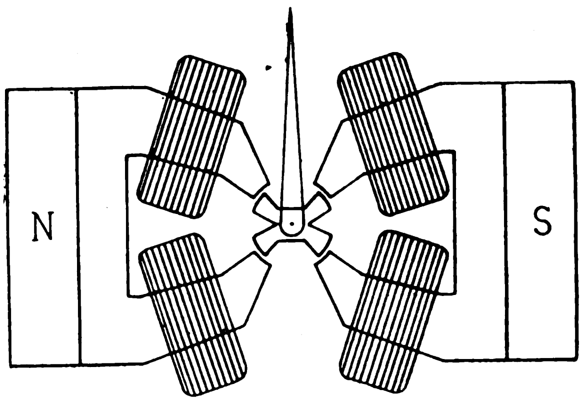

Fig 4.
Diagrammatic arrangement of magneto-oscillograph.

In order to "fix" the record, the strip is passed between little cylindrical rollers. In the model constructed in the works of Beaudouin, the rollers are worked by an electric motor, which serves also to draw out the paper and to smoke it.

In this manner we have been able to receive, not only European messages but also messages from the American stations, such as Annapolis (Fig. 5).

Other types of recorders have also been employed in wireless telegraphy, and in particular may be mentioned the Undulators, which are already in use for short distance submarine telegraphy. These consist of sensitive electromagnets, to the moving part of which is fixed a syphon pen, which writes on a paper tape which is continuously fed past it. These undulators are less rapid in action, and less sensitive than the magneto-oscillograph employing a dry point on a smoked surface, but they operate in a very satisfactory manner for the slow reception of strong signals.

In certain receiving stations good results have also been obtained, with

* H. Abraham and E. Bloch. *Revue Générale de l'Electricite*, 1920, *loc. cit.*

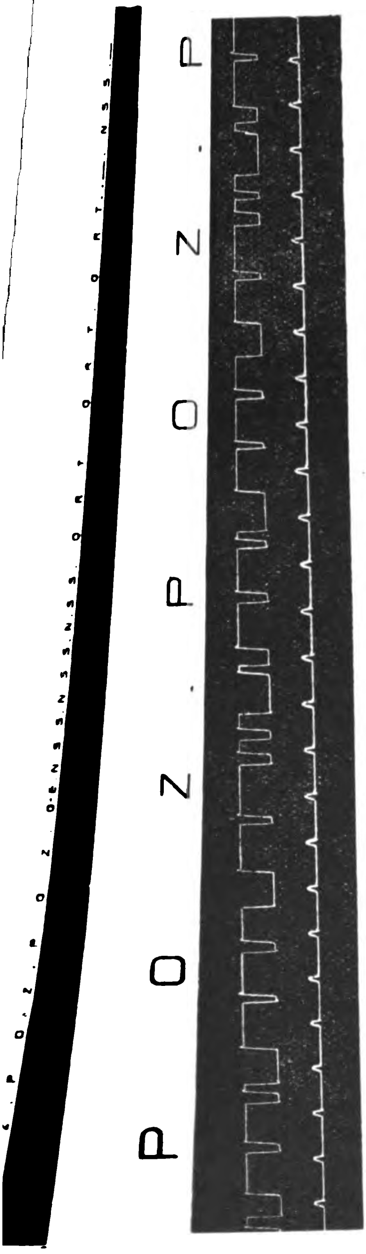

Fig. 5.

Reception in Paris of signals from Annapolis, March, 1920. Record taken with the magneto-oscillograph on smoked paper. The lower row in. each is a record of one-fifth-second impulses.

A = Reproduction of strip at ¼ size. B = Portion of strip, actual size.

fairly rapid transmissions by interposing a sensitive telegraph relay between the amplifier and the undulator. In this way there is more energy available to actuate the syphon pen, and then, by reducing the sensitiveness of the undulator, its speed of action can be increased very considerably.

It should be remembered that whenever an output energy of a few tenths of a watt is available from the amplifiers or relays, powerful electromagnets can be operated directly so as to enable the signals to be recorded by means of ordinary telegraphic or Morse apparatus. This method was used for recording the historic radiotelegram, reproduced in Fig. 6, by means of which the German High Command ordered the cessation of hostilities on all fronts at 11h.55, on November 11th, 1918.

RECORDING BY PRINTING.

But the recording of Morse signals is not sufficient; there remains one more step to reach the goal, for wireless telegraphy must reach the same stage of development as wired telegraphy in being able to record received signals on printing apparatus.

This final stage has been reached, thanks to the work of many groups of experimenters. We may mention, in particular, Messrs. H. Abraham and R. Planiol, in France; Messrs. Creed & Co., in England; and the Western Electric Company, in collaboration with the American Telegraph and Telephone Company in the United States.

The solutions put forward, which are almost the same in principle, consist

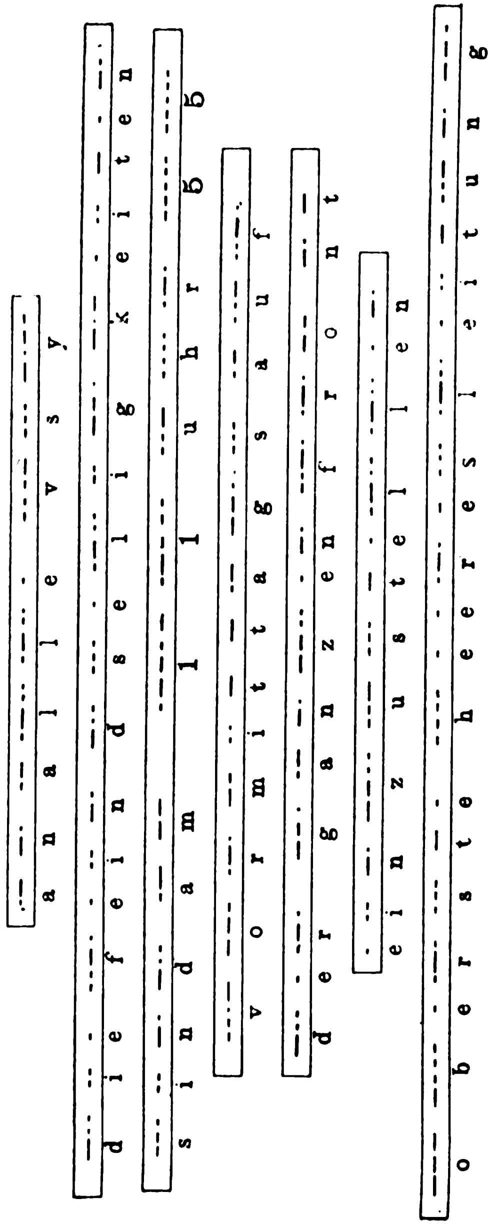

Fig. 6.

Photographic reproduction of the original Morse tape recording the radiotelegraphic order from the German High Command to cease fire on the whole front on November 11th, 1918.

in amplifying the received signals to as great a degree as possible, in order that they may actuate an ordinary telegraph relay of the printing system to be employed. It is also arranged that the transmitting station is controlled by an ordinary telegraph relay.

In printing by wireless telegraphy it is necessary that the transmitting station should have an extremely regular action. Up to the present it has been found that valve transmitters alone are suitable to the purpose; but we believe that it will be possible to make use of large arc stations and alternators.

The tests carried out by H. Abraham and R. Planiol were made with the object of making direct use in radiotelegraphic work of the Baudot apparatus so extensively employed in international line telegraphy.

The transmissions from a valve transmitting station are controlled by means of a Baudot relay of the ordinary pattern, which is operated by land line in the usual way. At the receiving end, the high frequency amplifiers, followed by an amplifier for continuous current, actuate in their turn a Baudot relay, also of the ordinary type, and the latter serves to forward the telegram over the land lines to the office of destination, where the distributors are located, and the so-called translating apparatus. This office of destination thus receives the wireless telegram under the same conditions as ordinary land line telegrams.

Traffic trials have been made with this sytem between Nogent-le-Rotrou and Paris. The results were satisfactory, and in particular it was proved that, thanks to the employment of the Baudot telegraph, it was possible to maintain perfect synchronism between the transmitting and the receiving apparatus in spite of "atmospherics," even when the experiment was tried of reducing the power of the transmitter up to a point when the reception began to become a little uncertain.

It has thus been established that it is possible to introduce a wireless telegraph transmission into the continental network of the Baudot telegraph system, and one can, for example, in certain cases, substitute a radiotelegraphic connection for the more expensive and less reliable submarine cable connection. It may reasonably be expected that a combination of wireless telegraphy with Baudot telegraph apparatus would result in the ability to deal with more traffic than could be handled by two submarine cables working at full load.

In the Creed experiments, the manipulation of the transmitter is automatic and the transmission is made with a Wheatstone perforated tape. The principle of reception in the Creed system consists in the utilisation of the currents supplied by the amplifiers to actuate an electro-magnet, which controls the perforating machine. The radiotelegrams are thus received in the form of perforated tape. This tape is then passed through an ingenious apparatus, which does the work of printing the messages in roman characters.

The Western Electric Company, though they have not yet published any esults, have been good enough to supply us with information. They have een successful in conveying an ordinary "Western" printed telegram by ireless between New York and Cliffwood. The messages were transmitted y wireless by a valve transmitting apparatus located at New York; they were eceived on amplifiers at Cliffwood, where they actuated a telegraph relay hich transmitted them back to New York, where the printing apparatus was stalled. Thousands of words were transmitted in this manner without rors.

Conclusions.

The facts which we have recorded above indicate that for some months st wireless telegraphy has entered upon a new stage in its development. e reception of messages by mechanical means has at last reached a practical

commercial value; this is a matter of no small consolation to those, who, like ourselves, have endeavoured to contribute their best efforts to the fulfilment of this object.

But the condition now exists, thanks to the efforts of all concerned, that the technique of reception is in advance of that of transmission. We are in a position to receive and record wireless messages at whatever speed we desire; one can print, if required, at the rate of ten or twenty thousand words an hour. Unfortunately, to obtain good reception good transmission is also essential; and it must be recognised that it is not yet very easy, particularly in the case of large stations, to regulate the working for such extremely high speeds. It is necessary, also, that the wavelength of the transmissions should be maintained rigorously constant throughout the transmission, and from day to day, and this state of affairs is not always attained. It will be necessary, finally, to overcome the effects due to atmospheric disturbances, and it would be very interesting to go into the consideration of the results which have been obtained in this direction. But that is another story.

THE EARTHING RESISTANCE OF ANTENNAE.

By Dr. Ing. A. Meissner.

(Communication from the Laboratory of the Gesellschaft für drahtlose Telegraphie.)

FOR many years one of the most important problems of radiotelegraphy has been the question of the best type of transmitting antenna for high-power work. Prior to 1911 no satisfactory solution had been found. On the one hand L-shape antennæ of 1,000 to 2,000 metres in length and 50 to 80 metres height had been built, while, on the other, the umbrella-shaped antenna was preferred by many. The former type was said to have a very pronounced directive effect, and theories have been worked out to prove the superiority of this type of antenna. It had also been proposed to use earth-antennæ for transmission purposes.

In order to determine the basis for the design of the long-distance radio stations which were projected about that time for erection in the German Colonies, the Telefunken Company resolved to carry out extended and more detailed experiments with antennæ. These researches were concerned with (1) the radiation from the antenna, and (2) the design of its leading dimensions, viz., the predetermination of its capacity, natural frequency and damping and the influence of the insulation of the metal parts of the masts, supporting wires, etc. The first experiments carried out at Nauen were followed by tests over longer distances, between Nauen and Jena. The following were the main results obtained at that time, relations which are still generally used in the design of antennæ :—

(1) That the statement that the radiation resistance is proportional to h^2/λ^2 is true for all shapes of antennæ.

(2) That within wide limits if the mean height is the

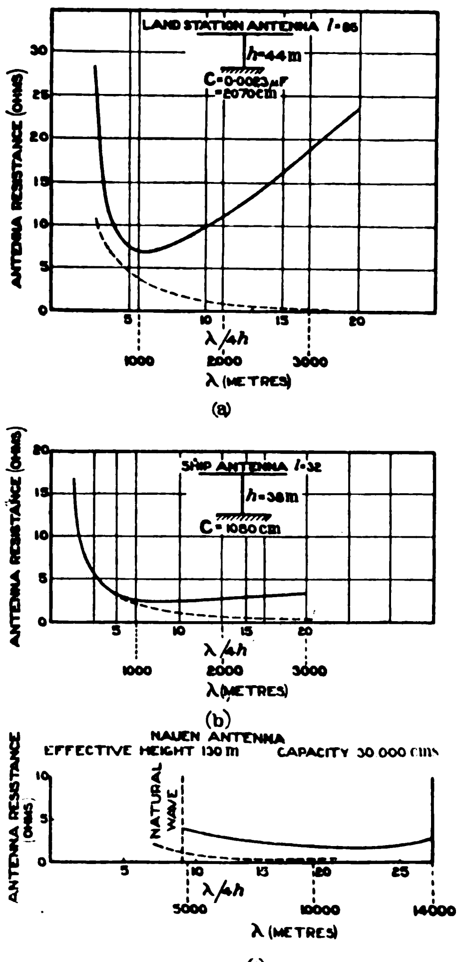

Fig 1.

same, the shape of the antenna has no influence. Umbrella, T–and L–aerials are equivalent if the earthing or counterpoise is the same; but an L–aerial is not so good if the length l is greater than four times the height h, on account of the losses in the ground.

(3) The directional effect of an L–antenna, when the loading * is more than 20 per cent., is practically negligible.

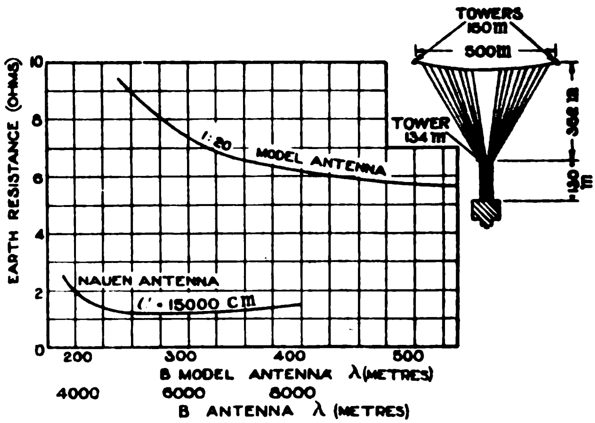

Fig. 2.

A solution of one problem was not obtained at that time, viz., by what means can the earthing resistance of the antenna be reduced?, and this question became of greater importance during the following years, since the efficiency of the whole antenna, especially for large aerials, depends mainly on the earthing resistance. Although the efficiency of the oscillation generator has during the past few years been increased up to 70 to 80 per cent, the

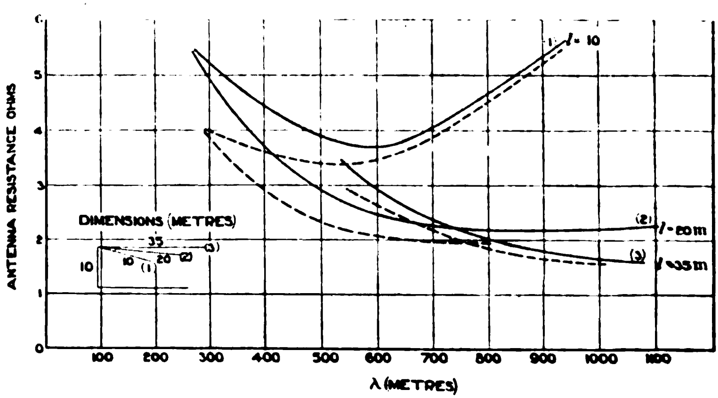

Fig. 3.

* This term is used throughout the article to represent the ratio $\lambda/4h$ *i.e.*, it is a measure of the amount the wavelength of the aerial increased (by loading) above the value $4h$.—ED.

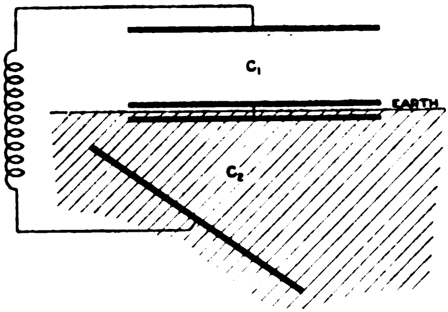

Fig. 4.

antennæ have become less effective as longer and longer wavelengths have been used, in order to decrease the absorption and to reduce the interference from other stations. Although the highest practical towers have been used, a radiation resistance of between 0·1 and a little over 0·3 ohm was the maximum obtained at wavelengths of 12 to 20 kilometres, while at the same time the earth resistance has increased to from 1½ to 5 ohms. Hence the efficiency of the whole antenna is but 5 to 15 per cent. It is obvious, therefore, that the problem of increasing the effectiveness of large antennæ can only be solved by a reduction of the earthing resistance.

The following results of research work indicate the best way in which to effect an improvement in the efficiency of large antennæ.

In Fig. 1 are given curves of the antenna resistance as functions of the wavelength or rather of the factor $\lambda/4h$, for the three chief types of antennæ: a normal land aerial, a ship aerial, and the aerial of a long-distance radio station. The curves show that the antenna of a high-power station having a capacity equal to 30,000 centimetres, has a much smaller resistance (2 to 3 ohms) than the small T antenna with a capacity of 1,000 centimetres, when both are loaded to the same extent, *i.e.*, the resistance of the antenna decreases when the dimensions are enlarged. (The earth resistances are indicated by the dotted lines.)

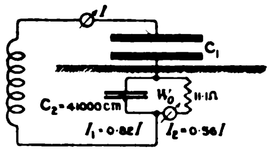

Fig. 5.

In 1913 and 1918, M. Abraham treated this problem theoretically and obtained the following result: that the product of the conductivity of the ground and the dimensions of the aerial is a constant. According to Abraham's theory, the earthing resistance of an antenna should be reduced to half if the dimensions are enlarged in the ratio 1 : 2 and the conductivity of the ground remains the same. The curves in Figs. 1a and 1c show that this theory is not rigidly obeyed in practice. Fig. 2 shows this more plainly. It gives the curves of the true earth resistance of a large fan-shaped L–antenna of mean height 80 metres, length 400 metres, breadth at the end 550 metres, and capacity 15,000 centimetres, and also of a model of the same antenna built on the scale of 1 : 20. It is seen that although the resistance is greatly reduced, it is not in the ratio of one-twentieth, although the ground was the same. It is, however, difficult to be certain whether the ground is identically the same near the earth wires at a depth of 2 to 5 centimetres and at a depth of 40 to 60 centimetres. Abraham's theory can only be applied if *all* the dimensions of the antenna are changed in the same scale, but it does not apply when only single ones are enlarged while others remain constant.

The question as to whether the earth resistance for a given wavelength can be reduced only by enlarging the antenna is a particularly important one. The curves in Fig. 3 relate to this question and refer to the case of twelve-wire umbrella type antenna, height 10 metres, length of wires 10, 20 and 35 metres, span 60 metres and with twelve earth wires, each 25 metres long. The curves show the great improvement obtained on long wavelengths when the antenna is enlarged from 10 to 20 metres, the resistance falling

more rapidly than proportionally to the increase in size. For example, at a wavelength of 900 metres :—

$$\frac{\text{Resistance of 20-metre aerial}}{\text{Resistance of 10-metre aerial}} = \frac{2 \text{ ohms.}}{5.3 \text{ ohms.}}$$

The proportionality, however, is not retained when the length of the antenna is increased from 20 to 35 metres, nor when shorter waves are used nearer the natural frequency of the antenna. These values were possibly somewhat influenced by the special conditions of the ground, since part of the area was flooded with water. The rapid rise of resistance indicated by curve 1 in Fig. 3, as the wavelength is increased is very striking. Howe has assumed that this rise must be a straight line, and consequently due to pure dielectric losses, which are inversely proportional to the frequency, and therefore directly proportional to the wavelength.

The antenna can be regarded as consisting of two capacities, the loss-free air condenser C_1 (Fig. 4) in series with the condenser C_2 having a bad dielectric. This arrangement is equivalent to that shown in Fig. 5, in which C_2 is repre-

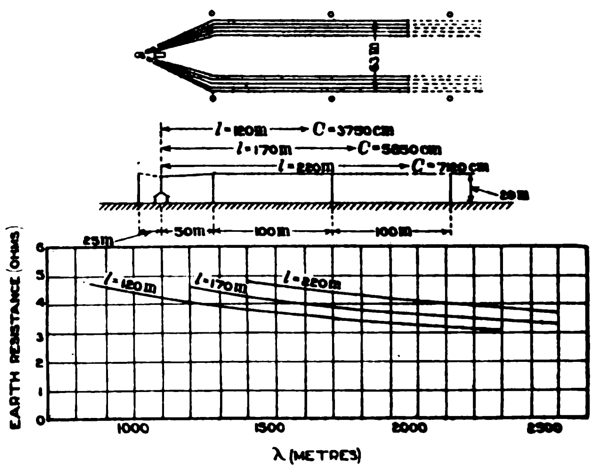

Fig. 6.

sented by a loss-free condenser in parallel with an ohmic resistance. The current I (Fig. 5) increases as C_2 is increased and as the wavelength is reduced. The resultant effective resistance W (*i.e.*, the measured earth resistance) therefore increases as the wavelength is increased and falls with increased capacity C_2. In general C_2 rises when the antenna capacity C_1 is increased, *i.e.*, W is reduced if the antenna capacity is increased. In this case the condition is that C_2 is increased if C_1 is increased—that is, that when the antenna is enlarged, the additional capacities C_1 and C_2, which are equivalent to the existing capacities are connected in parallel. This is not the case with some shapes of antennæ ; for instance, with L-shaped antennæ the values of W_0 and C_2 can be determined from the resistance curves in Fig. 3, and thus the ratio of the currents in both branches can be determined. Fig. 5 gives these current values for a wavelength of 650 metres.

Increasing the antenna capacity is, therefore, one means of reducing earth resistance ; but, unfortunately in practice, the fundamental wavelength of the aerial soon becomes comparable with the working wavelength, and this, again, causes the resistance to rise owing to proximity to the natural frequency of aerial. Hence it is difficult to reduce the resistance below 2 to 2·5 ohms, even when the capacity conditions are the most favourable. This

method of reducing the earth resistance is of no use for unsymmetrical antennæ, as then the resistance increases when the capacity is increased. Fig. 6 gives resistance curves for L-antennæ of different lengths (height of mast 20 metres, breadth of aerial 63 metres, number of wires 10, lengths 120, 170 and 220 metres, capacities 3,750 centimetres, 5,850 centimetres and 7,120 centimetres). From these curves it can be seen that when the capacity of the aerial was increased in the ratio 1 : 2, the resistance increased by 25 to 30 per cent. (*see* curves for 120 and 220 metres on wavelength 1,500 metres). These figures indicate that the additional capacity obtained by increasing the size of the aerial does not add in parallel to the original area; that is, that the capacity of C_2 in the diagram in Fig. 5 has been decreased instead of increased by increasing the antenna capacity C_1.

The question must now be considered whether a further reduction of the earth resistance is possible by the use of a counterpoise such as was first introduced by the Telefunken Company about this time. Fig. 7 shows the change in resistance when all the dimensions of an antenna were altered in the ratio of 1 : 2 and when a small counterpoise was used, the two aerials being respectively 10 and 20 metres in height, 10 and 20 metres in length

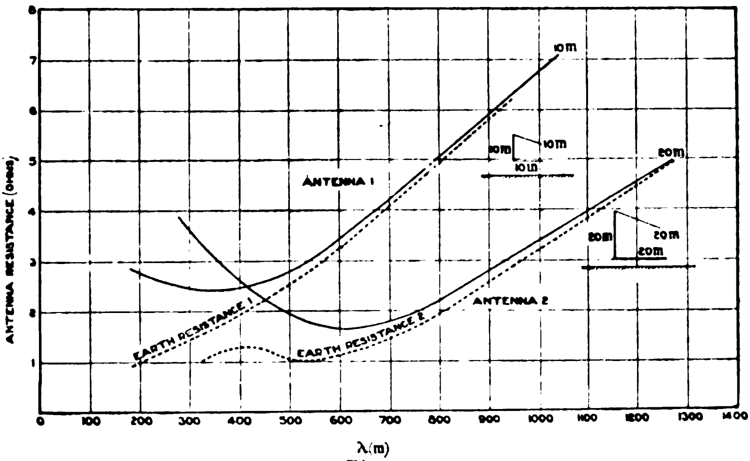

Fig. 7.

and having in each case eight wires and with a counterpoise of eight wires, firstly 10 metres long and, secondly, 20 metres long. Abraham's theory does not apply to this case, but it is seen that the resistance decreases if the antenna capacity is increased at a constant wavelength ($\lambda > 500$ metres). Also if the height of the antenna and the wavelength are kept constant a similar reduction of resistance takes place if the capacity is increased. Fig. 8 shows these results when using a larger counterpoise. The 12-wire umbrella type aerial had, in this case, a height of 30 metres, a span of 80 metres and wire lengths of 15, 25 and 50 metres, giving capacities of 1,000, 1,400 and 2,700 centimetres respectively. The counterpoise consisted of 50 wires 40 metres in length connected with a further 100 wires 40 metres in length. The resistance was found to decrease greatly with the capacity, and could be brought down below 1 ohm, that is, to a much lower value than was possible when using an earth connection, even if the aerial capacity was very large. Fig. 9 gives corresponding values for an L-antenna with a larger counterpoise (antenna 4 wires of 135 metres, height 21 metres, counterpoise 12 wires of 200 metres). It is seen that in this case the resistances are large for short wavelengths, but can be reduced below 1 ohm for long waves.

In 1915 a larger counterpoise was built at the Sayville station, in America,* and measurements were made on it by Professor Zenneck. At that time the antenna was of an umbrella shape, with a radius of about 240 metres, a capacity of 11,800 centimetres and a mean height of about 65 metres. The counterpoise extended a little beyond the area covered by the antenna, and had 56 wires, each about 265 metres long at a height of 2·5 metres, the underground water being 6 metres deep. The total resistance of the antenna was 1·55 ohms at a wavelength of 4,640 metres, this resistance being made up of an earth resistance 0·5 to 0·6 ohm, a radiation resistance of 0·31 ohm and a coil resistance of 0·7 ohm. These counterpoises were not yet large enough, as was shown by an arrangement of Rendahl's, at Karlsborg, in Sweden. The antenna there was of the cage type, suspended between two masts 210 metres in height, the length of the cage was 400 metres and its diameter 30 metres. It consisted of 60 wires and had a capacity of 8,000 centimetres. The ground below the antenna is rocky and was covered with a close counterpoise extending to a distance of more than 400 metres. The counterpoise wires were stretched at a height of 5 metres above ground at a distance of 3 metres apart, and were supported by 500 telegraph poles.

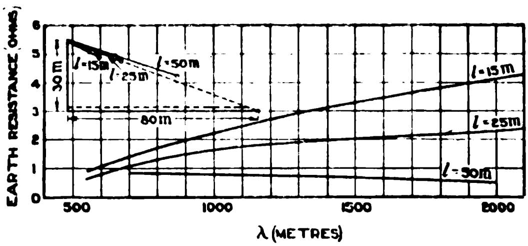

Fig. 8.

Four hundred kilometres of copper wire 1 millimetre in diameter, were used for the construction of the counterpoise. Rendahl gives the following values for the resistance of this antenna :—

Wavelength.	Radiation Resistance.	Total Resistance.
3600	4·95	5·2
5400	2·2	2·9

As the total resistances given above include the resistance of the loading coils, and these coils, having an inductance of 90,000 centimetres, certainly possess a resistance of about 0·7 of an ohm at a wavelength of 5,400 metres, the earth resistance must be less than 0·1 of an ohm. Thus, for the first time, the ideal small earth resistance such as is needed for long-distance wireless stations has here been attained. These small values have, however, only been obtained at great cost and the expense would greatly increase for a high-power station with a large area of antenna. For such antennæ the counterpoise would require a space of 5 to 6 kilometres if the wires are about 2,000 metres long.

On account of the large expense, the Gesellschaft für drahtlose Telegraphie was obliged to return to earth connections. After extended experiments an arrangement was found by which similar small resistances were attained, such as those of Rendahl's using large counterpoises. The principle employed is either to make the ground connections just at the point where

* *Jahrbuch der drahtlosen Telegraphie und Telephonie* 11, p. 235, 1916.

the lines of electric force from the antenna enter the ground, so that long current paths and eddy current losses in the ground are avoided, or to distribute the current from the generator on to a number of earth connections, such that each earth-point carries only as much current as corresponds to the lines of force from the antenna which enter the earth near that point.

When it is not possible to cover the whole surface of the ground with earth connections, then these should be placed where the greatest number of lines of force from the antenna enter the earth. It is in this respect that the greatest number of mistakes have been made in the design of aerial systems in the past, as usually the earth connections have been arranged in such a way that the current entered the ground at the centre of the antenna, or at a distance of about 100 metres from the centre, although the radius of the area covered by the antenna was from 400 to 500 metres. For all types of antennæ the centre line of the group of lines of force between the antenna and the ground lies at the extreme border of the area covered by the antenna. This fact may also be deduced from the simple formula given by Austin for the approximate predetermination of the capacity of antennæ, viz. :—

$$C = \left(0{\cdot}88\,\frac{a}{h} + 4\sqrt{a}\right) \times 10^{-6} \text{ microfarad.}$$

where a equals area of antenna and h equals its height. The capacity may be regarded as consisting of two parts; the first part is that of a simple plate condenser, having surfaces approximately equal in area to that of the

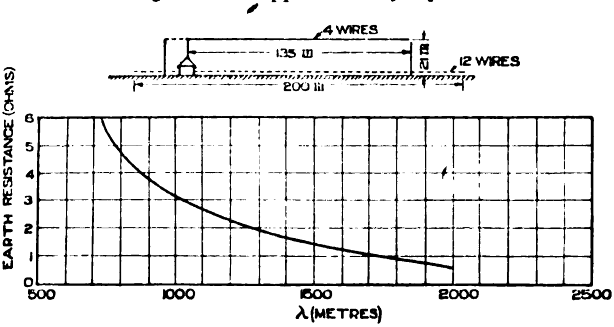

Fig. 9.

antenna, and the second part corresponds to the border line radiation field in the space beyond the area of the antenna. For the antennæ of high-power stations having a radii of 500 metres and a height of 200 metres, the second part is larger than the first, in the ratio of $35{\cdot}5 \times 10^{-3}$ to $34{\cdot}5 \times 10^{-3}$ microfarads. In other words, the major portion of the capacity of the whole aerial is due to the lines of force which reach the ground beyond the area covered by the antenna. The distribution of the current entering the ground can be obtained accurately from the field of force of the antenna, as determined by Maxwell (Fig. 10).

If the surface of the ground under the antenna is divided up into a number of rings of equal width (for example, 1 metre wide), and if the intensity of the lines of force entering each ring is determined and set out on a diagram, the total current due to the lines of force entering the ground may be represented by the shaded area A, in Fig. 10. The centre of gravity of this current area lies near the border of the area covered by the antenna, so that if the current paths through the ground are to be reduced as much as possible, the earth connections should be made on the border of the antenna area and the current leads from the transmitter brought to this position.

Fig. 10.

If, however, the current is led into the ground at the centre of the antenna, the whole of the current which enters the ground beyond the area covered by the antenna (*i.e.*, more than half of the total antenna current) must flow back through the earth along the whole length of the antenna. In the right-hand side of Fig. 10 is given the current distribution of an actual antenna, which was built as a model for an antenna of a high-power station on a scale of 1 : 20. This antenna was pentagonal in shape, as may be seen from the plan in Fig. 11. Its radius was 25 metres, its height 10 metres above the ground, and capacity 2,065 centimetres. The earth connections were arranged in four concentric rings under the whole of the antenna, and extended a distance beyond the area of the antenna equal to its height. Each earth connection was star-shaped (Fig. 12). Four conductors were led above the surface of the ground from the centre O (Fig. 12) of each earthing point to the four corner earth connections. Twenty-eight earthing "stars" were arranged in the first ring from the outside, 25 in the second, 15 in the third, and 5 in the fourth. Eighteen connections were made from the first ring to the centre of the aerial 13 from the second, 8 from the third, and 2 from the fourth. These connections were secured to the central mast at a height of about 3 metres. All the earth connections in each ring were connected together, and the current distribution to the various rings of earth points could be varied as required by adjusting the connections to the coil L (Fig. 10) or by adding, if necessary, more or less inductance in each earth connection. If the currents were adjusted by means of this inductance so that the whole system had the lowest resistance, the distribution of the total current in the four rings was as shown on the right-hand side of Fig. 10, the outermost ring carrying more than 50 per cent. of the total current. The current distribution in each ring as calculated from the diagram of the lines of force given in the upper left-hand half of Fig. 10 is set out in the second row of figures beneath the right-hand half of Fig. 10, the upper row of figures giving the actual currents that were obtained. On the lower left-hand side of Fig. 10 the earth resistances that were measured when single rings of earth connections were used are set out, the second and third lines giving the resistances when two and three rings of connections were used, and the fourth line the resistance of the whole combination of connections. When only the fourth, or inner, ring of earth connections is used, which gives an earthing scheme corresponding to those normally used, the resistance was 5·7 ohms, which is a reasonable value for an earthed antenna of this size. If the outer ring only

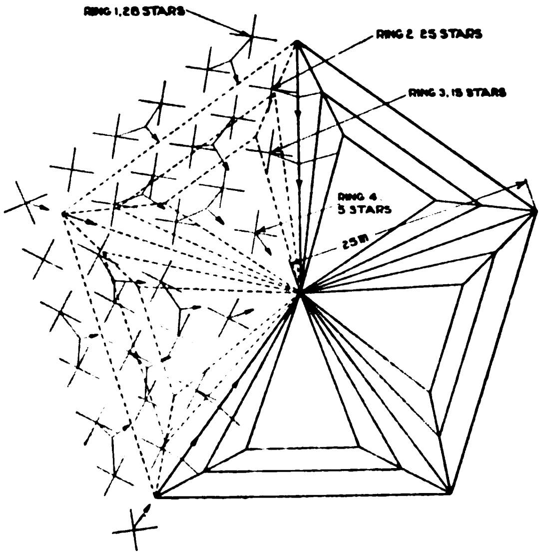

Fig. 11.

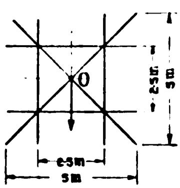

Fig. 12.

was used, the resistance fell to 0·64 ohm, but by combining all the rings together the resistance fell to less than the tenth of an ohm. This resistance was measured at various wavelengths down to 400 metres, above 1,200 metres it rises a little, and at 1,835 metres it was still less than 0·4 ohm. These measurements show that the earthings under the centre part of the antenna are of little value and could be omitted were they not required as connections to the outer border.

In later experiments the star-shaped earth connections were replaced by single pipes, by which means the earthing scheme was greatly simplified. Pipes, 3 centimetres in diameter and 1 metre in length, were driven into the ground to different depths, and the resistance measured in each case. These experiments indicated that the star-shaped connections shown in Fig. 12 can be replaced by four pipes at a depth of ½ metre at the four corners of the star.

It has been concluded from these measurements, by consideration of Abraham's model aerial theory, that we can with certainty expect that the resistance of an antenna twenty times as large will remain far below the values quoted above, and consequently that possibly fewer rings of earth connections will be required. An earthing scheme of this type is proposed for the projected extension of the Nauen station. As the antenna will have a mean effective height of from 190 to 200 metres, the radiation resistance will be from 0·3 to 0·33 ohm at a wavelength of 12,600 metres. As the resistance of the loading coils and of the antenna wires can be reduced below 0·3 ohm, the total resistance of the antenna should lie between 0·6 and 0·7 ohm. The efficiency of the new antenna will thus be about 50 per cent. instead of 7·5 per cent., as at present.

THE BIRTH AND EARLY HISTORY OF LONG-DISTANCE WIRELESS TELEGRAPHY.

By W. S. Entwistle.

On June 2nd, 1896, Senatore (then Signore) Marconi lodged his application for the first British patent for wireless telegraphy, and during the latter half of that year he gave demonstrations of wireless telegraphy over ranges of the order of one or two miles.

Early in the year 1901, that is, not more than four and a half years after the date of the application for the first patent, the distance over which messages could be interchanged had been increased to about eighty-five miles. Such progress could not be regarded as other than very satisfactory. It certainly exceeded the expectations of the many persons in the scientific world who had predicted that insuperable difficulties would be encountered in the attempt to extend the range of wireless telegraphic communication beyond a few miles. The view generally taken had been that, all other reasons apart, the curvature of the earth would impose an insuperable barrier to successful communication over distances of the order of fifty miles or so, except in the case of stations situated at a considerable elevation above the surrounding country. But although the fact that successul communication over a range of eighty-five miles between vessels at sea had been accomplished early in 1901 had completely discredited the views previously held with regard to the various difficulties that would probably be encountered, it had in no way prepared anybody to anticipate the sensational developments that took place during the year 1901.

On December 12th, 1901, that is, almost exactly twenty years ago and less than five years after his application for the first British patent for wireless telegraphy, Senatore Marconi succeeded in receiving wireless telegraphic signals at St. John's, Newfoundland, from Poldhu, Cornwall, a distance of 2,100 miles. This achievement, which was of a nature so sensational that its announcement was at first received by the scientific world with considerable scepticism, must be regarded as the birth of long-distance wireless telegraphy.

In order to form anything like a correct estimate of the merits of Senatore Marconi's achievement one has to bear in mind that twenty years ago the general knowledge and experience of high-frequency electrical phenomena was very limited. The radio engineer of to-day, who has at his command all the present-day appliances and facilities to assist him in his work, must find some difficulty in placing himself in the position of the worker of twenty years ago, who, working largely in the dark, was obliged to create for himself the very means for putting his ideas to the practical test. It is, therefore, of considerable interest to examine in the light of subsequent events the plans and means that were devised for this first attempt to signal across the Atlantic Ocean.

In April, 1900, Senatore Marconi had taken out his important patent, No. 7777, in which is described a transmitter having a closed oscillating circuit inductively coupled and tuned to the aerial circuit through an oscillating transformer, or "jigger." The closed circuit contained a condenser, a spark gap and the primary winding of the jigger in series. The condenser was charged by an induction coil and discharged through the spark gap and the primary winding of the jigger. The discharge of the condenser produced oscillations in the closed circuit, and the energy stored in the condenser gradually became transferred to the aerial or secondary circuit. This combination of a closed circuit forming a reservoir of energy

coupled and tuned to an open radiating circuit, gave a much more persistent train of oscillations in the aerial than did the earlier plain aerial arrangement that it superseded. The practical effectiveness of this new device was fully demonstrated when, by means of it on February 11th, 1901, Signore Marconi established communication between Niton (in the Isle of Wight) and the Lizard, Cornwall. The distance between these stations was 196 miles, or more than twice the maximum distance previously accomplished.

In October, 1900, Signore Marconi had commenced to build a high-power station at Poldhu, Cornwall, for the purpose of his coming attempt to signal across the Atlantic, and by the end of the year the engine house of the station was completed. Encouraged by the successful results of the Niton–Lizard tests, Signore Marconi, on February 14th, 1901, commenced the construction of the aerial and the transmitting plant at Poldhu. These features of the station were to be essentially similar to those of the Niton and Lizard stations, except as regards their increased size, and such alteration to detail as the increase of size necessitated. The transmitting aerial, which on previous occasions had generally consisted of two wires supported in a nearly vertical position on a single mast about 150 feet high, was at the Poldhu station to consist of several hundred wires in the form of an inverted cone, supported by a ring of twenty masts, each 215 feet high. The apex of the cone was to be connected directly to the secondary winding of the jigger *via* a "leading in" terminal in the centre of the roof of the transmitter room. This type of aerial was, however, never used for transatlantic tests, because the twenty masts that were intended to support it were wrecked in a gale on September 20th, 1901.

The destruction of the masts, although it represented a financial loss of several thousands of pounds, was not allowed to interfere with the continuance of the work, and early in October of the same year two jury masts, about 160 feet high and 200 feet apart, had been erected. Between these masts was suspended a fan-shaped aerial, consisting of fifty-four 7/20 gauge copper wires, and it was this comparatively small aerial that was employed for transmitting when the first transatlantic signals were received in Newfoundland on December 12th, 1901.

In the meantime the Marconi Company had acquired a site at Cape Cod, near Boston, Mass., U.S.A., for the purpose of erecting thereon another station similar to that at Poldhu. In November, 1901, the masts at Cape Cod unfortunately suffered the same fate as that of the Poldhu masts, and it was for this reason that Senatore Marconi decided to employ kites and balloons for supporting the receiving aerial during the first attempt to receive the Poldhu signals on the continent of America.

During the early experiments with the Poldhu transmitting plant the oscillation transformer through which the aerial was coupled to the closed oscillating circuit was of the same design as those employed at Niton and the Lizard, the cross section of the windings only being increased to enable them to deal with the larger currents that were employed.

The condenser in the closed oscillating circuit was constructed with glass plates 16 inches square, coated on each side with tinfoil and immersed in linseed oil in stoneware boxes. Each box contained twenty plates, and the capacity in each box was between 0·05 and 0·06 of a microfarad.

The generating plant installed for charging the condenser consisted of a 32 h.p. oil engine driving a 25 kW 50-cycle 2,000 volt alternator, and two 20 kW transformers were provided for stepping this voltage up to 20,000, or 40,000, if required. The general arrangement of the circuits employed when the first signals were received in Newfoundland is shown in Fig. 1. The alternator D, which was belt-driven by the oil engine, was connected through the choker CH to the step-up transformer T. The secondary voltage of the transformer was used to charge the condenser C_1 and the discharge path for the latter was through the primary loop of the air core transformer J_1 and the spark gap S_1. Air core "protecting" choke coils P CH_1 and P CH_2

were inserted between the oscillating circuit and the transformer secondary winding. The condenser C_2 became charged from the secondary winding of the air core transformer J_1, which had a step-up ratio of 1 to 10. The discharge path of the condenser C_2 was through the primary loop of the air core transformer J_2 and the spark gap S_2. The step-up ratio of J_2 was 1 to 7 and the two ends of its secondary winding were connected to the aerial and earth respectively. The length of the gap S_1 was 7·5 mm and that of S_2 35 to 40 mm. The capacities of C_1 and C_2 were 1·4 microfarads and 0·036 microfarads respectively.

It will be noted that no aerial tuning inductance was employed, and the circuit consisting of C_2, S_2 and the primary loop of J_2, was tuned to the aerial circuit by adjusting the value of the capacity of C_2. The circuit, consisting of C_1, S_1 and the primary winding J_1, was then tuned to the circuit consisting of C_2, the primary winding of J_2 and the secondary winding of J_1, and this was effected by adjusting the value of the capacity of C_1. Finally, the circuit consisting of the alternator D, the transformer T and the inductances CH P.CH_1 P.CH_2 C_1 and the primary loop of J_1 were either tuned to the frequency of the alternator by adjusting the value of the inductance in CH, or the alternator frequency was altered to suit the time period of the circuit. The wavelength of the aerial circuit was not measured, but was probably about 700 or 800 metres.

A certain amount of trouble was experienced before these circuits could be got to work satisfactorily. There was a marked tendency for an alternating current arc to form across the primary spark gap S_1, and when this occurred the spark at S_2 naturally failed. Oscillating discharges of sufficient duration to form the dots of the Marconi code could be readily obtained, but satisfactory dashes could not be produced with certainty. For this reason it was decided to employ the letter S instead of the letter V, which was generally used for practice purposes, as the test signal for the Newfoundland trials, as this letter in the Morse code contains no dashes, and, by this means, the necessity for transmitting dashes was avoided. Reference is made to this point, because when it was first announced that wireless signals had been received across the Atlantic, the suggestion was quite seriously made in certain quarters that atmospherical electrical disturbances had been mistaken for the signals originating at Poldhu. In support of this contention it was stated that it was well known that such atmospheric disturbances very frequently produced noises in telephone receivers consisting of a regular series of dots in groups of three, corresponding to the letter S in the Morse alphabet.

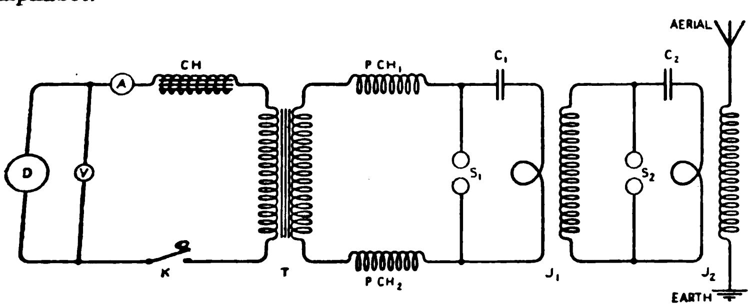

Fig. 1

On this point *The Electrician*, on January 17th, 1902, stated: "There are, however, many competent to form an opinion who consider that Mr. Marconi was deceived in believing that he heard faintly in a telephone the expected signal from Cornwall . . . . . ."

" It is quite possible Mr. Marconi may transmit any Morse signal between England and America, but he certainly has not done so yet."

Six weeks later (February 28th) the same journal remarked: "Meanwhile let the British public remember that the real foundation for all this talk about supplanting ocean cables is as flimsy as gossamer—nothing more, in fact, than an experiment with a somewhat unruly kite on the shores of Newfoundland by which Mr. Marconi heard faint clicks in a telephone. Only that and nothing more."

All question as to the genuineness of the signals received in Newfoundland was set aside when, in February, 1902, Senatore Marconi received on board the s.s. *Philadelphia* readable messages up to a distance of 1,551 miles, and signals up to a distance of 2,099 miles from Poldhu. These messages and signals were received on a Morse inker, and the Morse tape records of them are still in existence.

The arcing trouble was subsequently found to be largely due to excessive damping in the alternator circuit, caused by the large iron losses in the two inductance coils which formed the primary choke CH. The working of the circuits was later on greatly improved by removing the iron cores of CH and raising the frequency of the alternator to compensate for the consequent reduction in the time period of the circuit. A further improvement was made by replacing the spark balls at S_1 by two massive iron discs, which were slowly rotated so that the surfaces subjected to the action of the spark were changed continually. The " splitting " of the dashes, due to occasional arcing at the primary spark gap, was, however, not altogether eliminated until towards the end of 1902, when the circuits were rearranged in accordance with the diagram in Fig. 2.

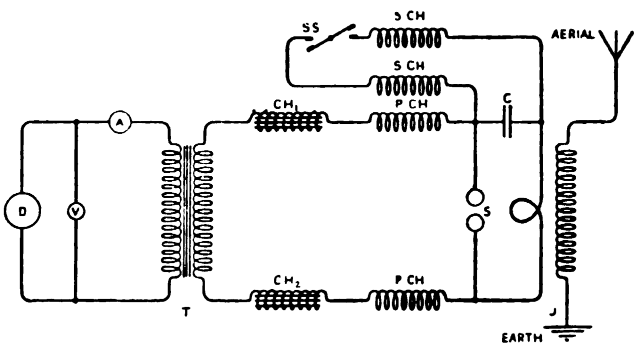

Fig. 2

Further difficulty was experienced in devising a satisfactory method of signalling. During the early transatlantic trials a switch K (Fig. 1) was used for making and breaking the primary circuit of the transformer T. It had a large number of pairs of contacts in series, and was worked by hand by means of a wooden lever. A good deal of manual effort was required to work the switch at ordinary telegraph speeds, but speeds between 10 and 15 words per minute were readily obtained with a signalling load of 8 or 9 kilowatts.

During the successful receiving experiments that were made in Newfoundland in December, 1901, the receiver was connected to a vertical wire about 400 feet long elevated by a kite. This arrangement was not very satisfactory, since variation in the wind caused variations in the electrical capacity of the wire. Consequently an ordinary syntonic receiver was not the best suited for the purpose in hand. The signals were received, however, with three types of receivers, namely, one containing loose carbon filings, another, designed by Senatore Marconi, containing a mixture of carbon dust

and cobalt filings, and a third, known as the "Italian navy coherer," consisting of a globule of mercury between two plugs, one of steel and the other of carbon. The tests were brought to an end by the action of the Anglo-American Telegraph Company, which claimed all telegraphic rights in Newfoundland, and who apparently saw reasons for fear in the prospect of the commercial development of transatlantic wireless telegraphy.

In February, 1902, the receiving tests were continued on the s.s. *Philadelphia*, and in this case the receiving aerial was fixed to the mast, the top of which was about 200 feet above sea-level. The electrical capacity of the aerial thus remained practically constant, and very good results were obtained with the ordinary syntonic receiver. Readable messages were recorded on tape by means of a coherer and a Morse inker at 1,551 miles, and indications were received up to 2,099 miles. None of the various types of receivers used in the previous Newfoundland tests would give signals over a range of more than 900 miles. The most important result of the tests, from a scientific point of view, was that the signals transmitted during the daytime were never received at a range greater than 700 miles. This shortening of the range during the hours of daylight constituted one of the most serious problems that engaged Senatore Marconi's attention during the following years, and the investigations that he made in elucidating the matter lead later on to the discovery of many interesting and complicated phenomena, such as the great variation of signal strength during the period of sunset and sunrise, and the difference in range obtainable with given installations when employed in transmission east to west and north to south respectively. Prior to the year 1902 these phenomena were entirely unknown, owing to the fact that they had not asserted themselves to any marked degree over the comparatively short ranges that had hitherto been attempted. Even to-day entirely satisfactory interpretations of these phenomena are wanting; but in 1902 Senatore Marconi discovered a partial solution to most of the difficulties occasioned by them. He found that increasing the length of the waves employed caused the daylight range to approach that of the night-time, and minimised the variations.

During the same year Senatore Marconi invented his well-known magnetic detector, and with it carried out a long series of receiving tests on board the Italian battleship *Carlo Alberto*, which had been placed at his disposal by the Italian Government. On board this vessel signals were received from Poldhu in various parts of the world, such as Kronstad, Ferrol and Glace Bay.

The reception of Poldhu signals in Newfoundland caused the Canadian Government to show interest in the question of establishing a direct wireless telegraphic service between England and Canada, and, under an agreement dated March 17th, 1902, they granted a subsidy of £16,000 for the establishment of a large station at Cape Breton, Nova Scotia. This station was completed before the end of 1902, and on December 18th in that year wireless messages were despatched by Senatore Marconi and the Earl Minto from Cape Breton to His Majesty King Edward VII. Senatore Marconi also sent a message to King Victor of Italy.

In the meantime Poldhu station had been equipped with a new transmitting aerial, supported on four wooden lattice towers, each 215 feet high and arranged about 200 feet apart on the four corners of a square. The aerial, consisting of about 100 wires in the form of an inverted pyramid, was suspended from insulated steel stays stretched between the tops of the towers. Similar towers and aerials were erected at the Glace Bay and Cape Cod stations. Subsequently each of the wires in the Poldhu aerial was furnished with a nearly horizontal extension, and thus the aerial became of the now well-known "umbrella" type. Owing to the increased length and greater electrical capacity of these aerials, as compared with the earlier "fan" aerial, their natural wavelength was greatly increased, and they enabled an increased transmitting power to be effectively employed.

The Glace Bay station had, in the first place, been equipped with a 100 h.p. transmitting plant, and in 1903 a new 100 h.p. steam-driven alternator set was installed at Poldhu, the original 32 h.p. oil-driven plant being retained as an emergency set. Towards the end of 1902 the Poldhu transmitting circuits had been rearranged in accordance with the diagram in Fig. 2. The secondary spark circuit, containing S_2, C_2 and J_2 (Fig. 1) was done away with and the aerial and earth were connected to the secondary winding of the jigger J. Two high-tension choking coils, CH_1 and CH_2 (Fig. 2), were inserted in the secondary circuit of the transformer T. These choking coils had open iron circuits and the magnetic density in the iron and the current density in the copper were kept low in order to minimise the losses in the circuit. By this means a voltage of about 100,000 was obtained across the condenser C with an impressed voltage (alternator voltage × transformer ratio) of about 8,000. The capacity of C was about 0·2 microfarad and the spark gap S during the full power trials was 5·5 cm. The signalling switch SS was connected across the condenser C through the two coils S CH. With the signalling switch closed, the voltage in the circuit was equal to that of the alternator multiplied by the transformer ratio, and this caused a relatively small wattless current to flow through the circuit. When the switch was opened the condenser became charged to its proper working voltage and discharged across the spark gap. This signalling device was capable of manipulating the circuit at ordinary telegraphic hand speeds, with a signalling load of 50 or 60 kW.

In this connection it is of interest to note that, in the leading article in the *Electrician* of January 17th, 1902, from which we have previously quoted in another connection, the opinion is stated in all solemnity that—" The enormous power used for that long distance will probably make it impossible to send more than four, or at most five, words per minute. . . ."

There can be no doubt, however, that the attitude adopted by the electrical press, and others, at that time was inspired by a fear that the interests of the cable companies would be adversely affected by the success of Senatore Marconi's work.

The increased wavelength and power employed in the transmitters enabled the stations to communicate satisfactorily across the Atlantic for the greater part of each day during the winter months, and for shorter periods during the summer. From the latter half of 1903 and onwards the stations were employed on long-distance transmission of news and private messages to ships crossing the Atlantic. The first two ships to be fitted with special receiving apparatus for this work were the *Lucania* and *Campania*, belonging to the Cunard Steamship Company. The service was greatly appreciated by the passengers, and subsequently was shared by a large number of other passenger vessels.

The experience gained during the years 1902 and 1904 with the long-distance stations proved definitely that, in order to establish a commercially successful wireless telegraph service across the Atlantic, larger powers and longer waves than those hitherto employed would be required. On the other hand, it had been found that the use of larger aerials and greater wavelengths had a tendency to increase the trouble caused by the atmospheric disturbances commonly known as " strays " or " X's." Since the introduction of the magnetic detector, the use of the coherer and Morse inker had been abandoned for long-distance work, and the signals were received by ear from a telephone connected across the secondary coil of the magnetic detector. The sounds produced in the telephone by the " X's " were frequently much louder than those produced by the signals. Even when the " X's " were only of the same strength as the signals they were generally indistinguishable from the latter, and thus marred the proper reception of the messages.

In order to overcome this difficulty Senatore Marconi conceived the idea of greatly increasing the spark frequency of the transmitter, so as to raise the pitch of the note produced in the telephone To this end he devised his well-known disc discharger, which consists essentially of a steel disc

about 4 feet in diameter, on the rim of which a number of copper studs are fixed. When the disc is revolved, the studs pass in succession between two slowly-revolving copper discs, which are connected to the condenser circuit in place of the ordinary spark gap (see Fig. 3). In this way a regular series of condenser discharges is obtained, and the spark frequency can be altered at will by varying either the speed of rotation of the steel disc or the number of studs in its rim. Such a transmitter will produce a musical note in the telephone of the receiver, which can readily be distinguished from the noises produced by the "X's" or from the signals of other transmitting stations. A further advantage obtained by the employment of these revolving disc dischargers is that the damping in the condenser discharge circuit is greatly reduced. Each discharge of the condenser commences when a moving stud approaches the two copper disc electrodes. The actual length of the gap between the stud and the disc electrodes at the moment the discharge commences depends upon the voltage to which the condenser is charged, but during the discharge the gap becomes progressively shortened by the movement of the stud. Thus the damping due to the resistance of the spark gap is greatly reduced.

Another notable step in the early history of the development of long-distance wireless telegraphy was the discovery, made early in 1905, by Senatore Marconi that the radiation from a horizontal aerial, one end of which is earthed, is greatest in the direction away from the free or unearthed end. The natural corollary to this is that an aerial of this type, when used for receiving, will best absorb radiation from the direction in which it radiates most when used as a transmitter.

Early in the year 1905 Senatore Marconi put in hand the plans for the erection and equipment of a new high-power station, with a view to establishing a regular commercial service across the Atlantic. A site was chosen for this station at Clifden, County Galway, and work was started on the site in October, 1905. The equipment of this station was on the same lines as that of the Poldhu and Glace Bay stations, except that the power of the transmitter was increased to 300 kW and a horizontal directional aerial was employed. A notable departure from the earlier practice was the employment of an air condenser in place of the usual glass plate condenser, the maintenance of which had proved very expensive on account of the frequent breakages which occurred. The building in which this condenser was housed measured 350 feet in length and 75 feet in breadth, and the height at the eaves was 33 feet. The condenser itself consisted of 1,800 galvanised steel sheets, each measuring 30 feet by 12 feet, suspended from the roof ties of the building by porcelain rod insulators. The dielectric space between the sheets was 12 inches wide, and the total capacity was 1·8 microfarads. The dielectric losses in the condenser were found to be very small, as compared with those of the glass condensers hitherto employed, with the result that the damping of the primary oscillating circuit in the Clifden transmitter was correspondingly reduced. The condenser was tested up to fully 150,000 volts in conjunction with a spark discharger having a 6 cm gap between zinc spheres 6 inches in diameter. The air concussion occasioned by such a high potential discharge of so large a capacity was naturally terrific, and the magnitude of the discharge current was so great that when the spark was left running continuously for a few seconds the zinc spheres melted.

In the design of the station provision had been made for the installation of Senatore Marconi's new disc dischargers. The delivery of these machines, however, became delayed, and the preliminary tests of the station were carried out with a fixed spark gap, which, with maximum transmitting power, consisted of two gaps in series, each 3 cm in length. The signalling circuit was the same as that employed at Poldhu (see Fig. 2), but the signalling switch was electromagnetically operated.

When the disc dischargers were installed, they were arranged to give a spark frequency of about 350 per second. Under these conditions it was

necessary to reduce as much as possible the time period of the condenser charging circuit, since the time available for each combined charge and discharge of the condenser was now not more than 1/350th of a second. To this end the two choking coils CH_1 and CH_2 (Fig. 2) were removed from the circuit and others of comparatively small inductance and having no iron cores were substituted for them (see Fig. 3).

The above-mentioned change necessitated the employment of other means for signalling than that shown in Fig. 2. Because of the low value of the inductance in the charging circuit, the idle current through the signalling switch when the latter was closed became greater than the normal working current. The switch consequently " flared " and caused the signalling to be slow and faulty.

The method of signalling that was finally adopted is illustrated in Fig. 3. The two signalling switches SS_1 and SS_2 are placed in the transformer secondary circuit, and when open they completely interrupt the condenser-charging current. A low-pressure air blast at each of the switch contacts extinguishes the arc that tends to form at the moment the switches open. This method of keying the circuit proved very satisfactory, and was subsequently developed to the extent that signalling speeds up to 85 words per minute were attained on full power.

The introduction of the disc discharger proved to be one of the most important steps in the early development of long-distance wireless telegraphy. The reception of signals during times when " X's " were prevalent was made very much easier, since the musical note of the signals was quite readily distinguishable from the sounds produced by the " X's." A further and important advantage obtained by the use of the new discharger was that the maximum potentials in the transmitting circuits and aerial were very much lower for a given power.

The aerial system at the Clifden station is of the horizontal directional type, consisting of thirty wires supported by twelve wooden masts, each about 210 feet high. The width of the aerial at the end nearest to the condenser house (in which the transmitter is situated) is about 700 feet, and at the far end about 1,150 feet. The total length of the aerial from the " leading in " insulator is about 2,100 feet.

The earth system originally consisted of two sheets of heavy copper gauze, each 4 feet wide and 600 feet long, buried in the ground in line with the aerial, but running in the opposite direction. For about 200 feet of their length the copper gauze earth strips were laid at the bottom of a lake situated about 400 feet away from the transmitting house, and whose area is about 10 acres. Under the aerial and running the full length of the latter were a number of galvanized iron wires buried in the earth and connected to the steel frame of the condenser house. The frame of the condenser house was also connected to the two copper gauze strips.

Whilst the Clifden station was being built the station at Glace Bay was removed to a larger site, and re-equipped with a transmitting plant and aerial similar to that installed at Clifden, and it was by means of these two stations that a limited public service was inaugurated on October 17th, 1907, and this service was made available to the general public on February 3rd, 1908.

The experience acquired at Clifden prior to the opening of the public service and during the first year or so of that service was extremely valuable, and led to many important improvements in the details of both the transmitters and receivers. The magnetic detector was considerably improved, and instead of being connected directly to the aerial circuit, was employed in a weakly-coupled secondary circuit. Later on the magnetic detector was replaced by a new type of receiver devised by Senatore Marconi, in which a Fleming valve was employed as a rectifier. Later on this was superseded by the carborundum crystal receiver.

The receiving aerial originally employed at Clifden consisted of two wires, each about 2,100 feet long, supported on the tops of the masts of the transmitting aerial. Subsequently these were replaced by four wires, each 4,000 feet long, and the average strength of the received signals was greatly increased thereby. A large measure of success in eliminating the effects of

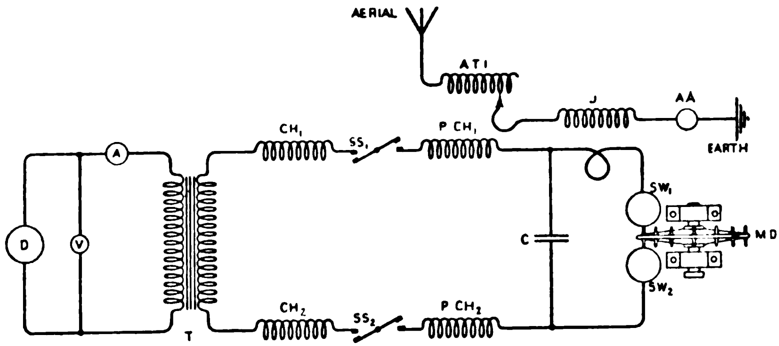

Fig. 3.

atmospherics was obtained by the employment of two balanced circuits in the receiver. One of these circuits was tuned to the wavelength being received and the other was tuned to some other wavelength. The signals came through on the former circuit only, whilst the atmospherics affected both circuits equally and the effects could be neutralised by opposing them.

With a view to improving the clarity of the tone of the signals, Senatore Marconi experimented with the use of high-tension direct current for charging the transmitting condenser. These experiments were very successful, and in 1909 both stations were equipped with high-tension direct current generators and a 12,000 volt storage battery consisting of 6,000 cells of 30 ampere-hours capacity. Four high-tension direct current dynamos, each with an output of 10 amperes at 5,000 volts, were installed at each station for charging the batteries. Three of the dynamos were connected in series for this purpose, the fourth being a spare. Single-phase motors supplied with current from the 300 kW alternator were used for driving the direct current dynamos, and, during transmission, the battery and dynamos were usually paralleled. When the traffic was light the transmitter could be worked for several hours from the battery alone, and this had the effect of improving the load factor of the plant. After conversion to direct current working the transmitting power in the aerial was about 80 kW and the dynamo to aerial efficiency was about 50 per cent. The plant remained in satisfactory operation at Clifden until the end of 1920, when a large valve transmitter was installed. The original high-tension dynamos and battery are now used for supplying the current required for working the new valve transmitter.

Recent developments in the art of wireless telegraphy have lead to the general employment of continuous or undamped waves, but it is hardly within the scope of this article to deal with these developments. The "Early History of Long Distance Wireless Telegraphy" might very appropriately be made to finish with the establishment of a commercial transatlantic service in February, 1908, but a reference here to the early work of Senatore Marconi in connection with transmitters for producing continuous waves is not out of place.

The idea of employing high-frequency alternators for the transatlantic work was suggested by Senatore Marconi in 1902, when it was first realised that comparatively long waves would have to be employed ; but no suitable

alternators were available in those days, neither did there appear to be any prospect of getting such machines designed and manufactured. The invention by Poulsen, in 1903, of the arc type of high-frequency generator opened up definite prospects with regard to the employment of continuous waves for wireless telegraphy. For several years, however, very little progress was made in this direction. The early types of arc generators were inefficient and unreliable and difficulty was experienced in finding a suitable and efficient receiver for continuous oscillations.

In 1907 Senatore Marconi produced a form of continuous wave transmitter (see Fig. 4) consisting of a large metal disc A capable of being rotated at high speed, and two smaller discs C, C, which could also be rotated at high speed, placed very close to the edge of the large disc A and arranged in a plane at right angles to that of the large disc. The two smaller discs C, C, are connected through brushes to the outer terminals of the two condensers K, which are joined in series and charged through suitable inductive resistances I, I, by a high-tension continuous current dynamo H. The middle point of the two condensers K is connected to the disc A through the oscillating circuit containing the condenser E and the primary coil of the oscillating transformer F. If the discs are rotated at a sufficiently high speed and a sufficiently high electromotive force is applied across the condensers, oscillating discharges will take place between the edge of the large disc and the two smaller ones and oscillations will be set up in the circuit E, F.

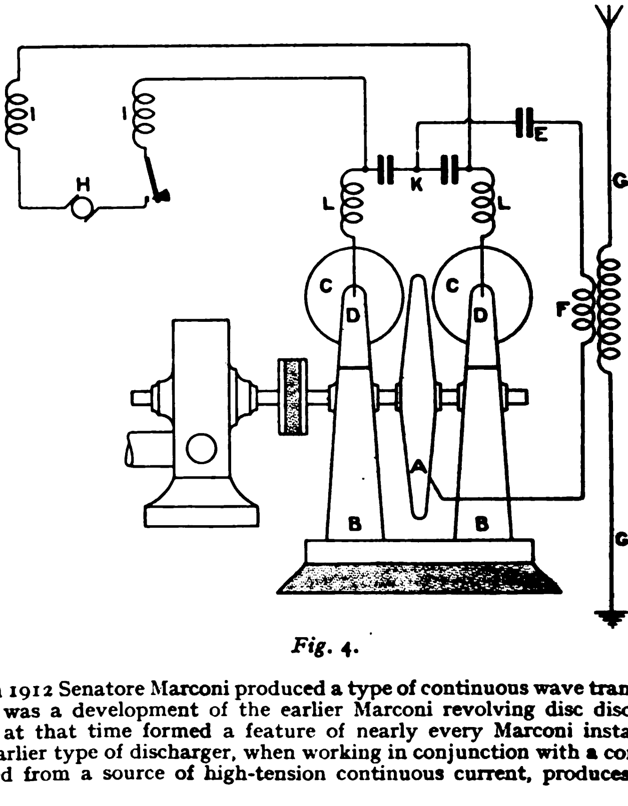

Fig. 4.

In 1912 Senatore Marconi produced a type of continuous wave transmitter which was a development of the earlier Marconi revolving disc discharger, which at that time formed a feature of nearly every Marconi installation. This earlier type of discharger, when working in conjunction with a condenser charged from a source of high-tension continuous current, produces in the

aerial a series of equally spaced groups of secondary oscillations. If the spark frequency of such a discharger be gradually increased, the time interval separating the end of one group of secondary oscillations from the beginning of the next one will gradually decrease, and a point will be reached at which the successive groups begin to overlap each other. If the phase relation between the overlapping groups is suitably timed, the oscillations in the aerial will become continuous, but they will vary in amplitude. The variation of amplitude will, however, decrease as the primary spark frequency is further increased, and by employing a suitably high spark frequency, continuous oscillations of constant amplitude can be produced in the aerial.

In order to obtain the correct phase relation of the successive groups it is necessary to ensure great accuracy in the spacing of the studs on the rim of the disc. The studs must also travel at a very high velocity. The higher the frequency of the oscillating circuits, the higher must be the stud velocity for a given degree of accuracy in the tuning. It is also necessary to keep the speed of the disc constant within very narrow limits, and the speed must be such that the interval between the beginning of each discharge is equal to the period of oscillation of the aerial or an exact multiple of that period. In practice it was found that all the above-mentioned conditions could be fulfilled when dealing with small powers in the circuits. When an attempt was made to increase the power to more than a few kilowatts the studs and side electrodes burnt too rapidly to allow the necessary accuracy of timing to be maintained. In order to overcome this difficulty, the timing of the discharges of the main condenser was arranged to be controlled by a timing or " trigger " disc. To this end the gaps between the studs and the side electrodes of the revolving discharger are set at such a length that the condenser cannot discharge across them until they are ionized by a small spark, which is provided at the correct instant by the " trigger " disc circuits.

The working of a transmitter of this type was demonstrated early in 1913 to the British Government Committee that was appointed to report on the merits of the then existing systems of long-distance wireless telegraphy. In their report, dated April 30th, 1913, this Committee stated :—

" The only continuous high-frequency generator we have yet seen tried with success over long distances is the Marconi continuous high-frequency machine, to which we have already referred. For the purpose of witnessing transatlantic experiments with this machine we paid a second visit to Clifden, and experiments were made with it in our presence. Using it, Mr. Marconi on the 26th and 27th of April, 1913, sent from Clifden to Glace Bay messages prepared by us for the purpose, such messages being at our request at once repeated from Glace Bay by means of the Company's ordinary plant and correctly received at Clifden. The power put into the aerial by this machine for the purpose of the experiments was not sufficient for commercial purposes, but there seems no reason why higher power should not be obtained."

During the demonstrations on the 26th and 27th of April, 1913, the power supplied to the aerial by the continuous wave transmitter was about 20 kW. A larger transmitter of the same type was tested at the Marconi Company's Carnarvon station, in 1914, when a power of 60 kW was obtained in the aerial. The Marconi transatlantic stations at Carnarvon, North Wales, Stavanger, Norway, and New Jersey, U.S.A., were equipped later on with continuous wave transmitters of the same type, capable of a high-frequency output of 200 kW.

In Fig. 5 is shown a diagram of the arrangement of the discs and circuits of the continuous wave transmitters that were installed at Carnarvon.

Referring to the diagram (Fig. 5), the H.T. D.C. generator has a voltage of 5,000, and charges the three condensers C_1 C_2 and T P C through suitable inductances and limiting resistances. The trigger disc T D carries on its rim twice as many studs as there are on each of the main discs M D_1 and M D_2. The trigger disc discharges the condenser T P C, and at each discharge of T P C the trigger secondary condenser T S C discharges across the gap T S G. With the main disc M D_1 and M D_2 in the position shown in the

diagram the discharge of T S C will cause ionizing sparks to occur between all four of the upper electrodes and the studs on M D_1 and M D_2 which are opposite to them. By the time the next trigger discharge occurs the discs M D_1 and M D_2 will have moved to such a position that two studs on each

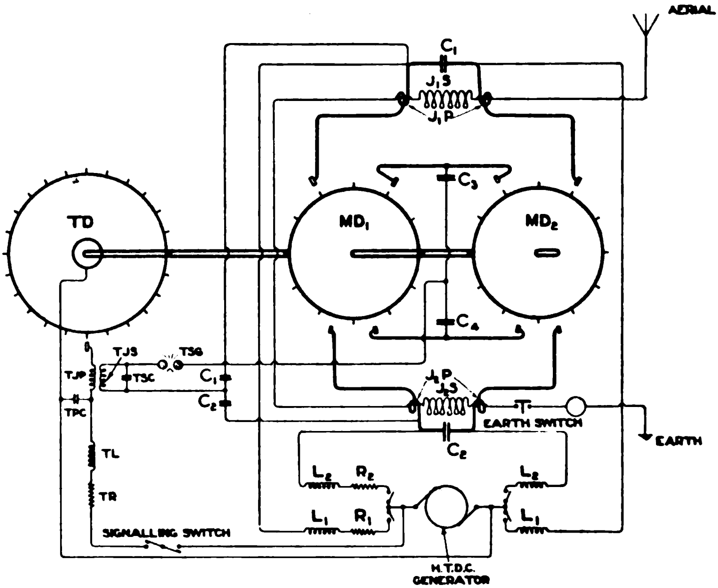

Fig. 5.

will be opposite the four lower electrodes and the discharge of T S C will cause ionizing sparks to occur between the four lower electrodes and the studs on the discs. The frequency of the discharge circuit of T S C is made as great as possible, and it may be perhaps fifty times as great as that of the main circuits.

The condenser C_1 discharges through the primary winding J_1 P, and the four upper spark gaps on the main discs. Condenser C_2 discharges through the other primary winding J_2 P and the lower four spark gaps on the main discs. The primary windings of the main jiggers J_1 P and J_2 P are each in two halves with the condenser connected between them. This ensures the ionizing of all four of the main gaps when the trigger discharges take place. The side electrodes of M D_1 and M D_2 are arranged so that the condensers C_1 and C_2 are discharged alternately. The secondary windings of the two jiggers are connected in series in the aerial circuit.

The timing of the trigger discharges is set so that the main discharge does not take place until the studs on the main discs are right opposite the side electrodes. As the studs move away from the side electrodes the discharge is rapidly quenched by the lengthening of the gaps and the quenching is further assisted by high-pressure air blasts from four nozzles, mounted one on each of the side electrodes. A tight coupling, about 10 per cent., is employed between each primary circuit and the aerial, and the quenching of the primary discharge, as soon as the energy has been transferred to the aerial circuit, prevents reaction between the primary and aerial circuits.

Fig. 6 shows diagrammatically the oscillations (*a*) in the trigger circuit, (*b*) and (*c*) in the two primary circuits, and (*d*) in the aerial.

The velocity of the trigger stud tips is about 200 metres per second, and as the wavelength of the Carnarvon station is 14,000 metres, the distance through which a trigger stud travels during one oscillation is 9·4 mm. This distance is great enough to ensure that any error in the timing, due to irregular burning away of the tips of the trigger studs, will be negligible.

At Carnarvon the timed spark transmitters were capable of putting 200 kW into the aerial with an efficiency of about 67 per cent. Under normal working conditions the aerial input was 150 kW, and this was obtained with an output of 225 kW from the high-tension direct current machines. The signalling was effected by interrupting the charging current of the trigger primary condenser. As this current was only about 0·3 of an ampere at 5,000 volts, signalling speeds of over 100 words per minute were readily obtained.

The signalling switches were capable of operating the transmitter at full power at any speed up to 200 words per minute without any blurring of the signals being detected at short range, but at the maximum range such speeds could not be employed. The reason for this is that at very high speeds the transient period during which the current amplitude in the transmitting aerial is growing under the action of the primary discharges, forms a large proportion of, or may even become greater than, the period occupied by a Morse dot. Thus, at very high speeds, the current amplitude in the transmitting aerial does not reach the same value during a dot that it attains during a dash. The resulting disparity between the strength of the received dots as compared with that of the dashes is accentuated by

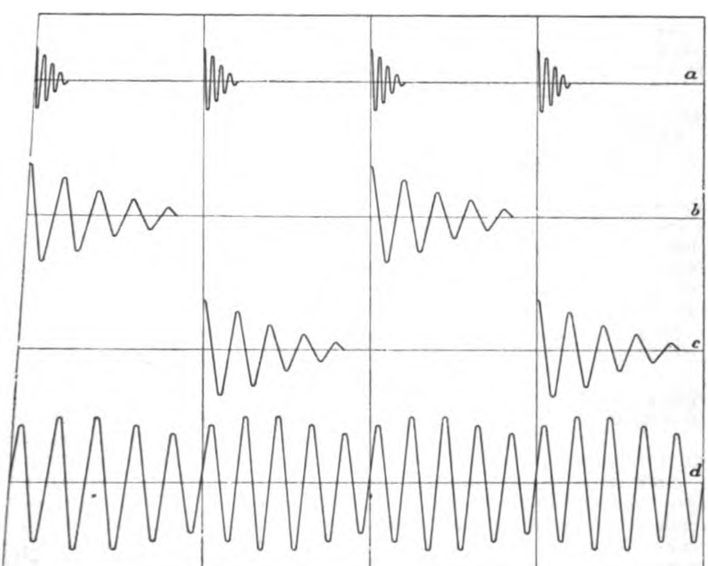

Fig. 6.

similar conditions which exist in the receiver, where the current amplitude in the receiving aerial gradually grows under the E.M.F. impressed by the signal.

It is probable that at the time these large Marconi continuous wave transmitters were introduced for transatlantic work they were the only transmitters of either the damped or continuous wave type which were capable of being operated at speeds above 100 words per minute with a power of 200 kW in the aerial. They formed the connecting link between the damped wave spark transmitters and the more modern continuous wave transmitters, such as the high-frequency alternator and the thermionic transmitting valve.

At the present time a great army of workers is employed in further developing and perfecting the art of long-distance wireless telegraphy and telephony, and in elucidating the many still unsolved problems associated with the propagation of electromagnetic waves round the earth. The initiative in all this work was taken by Senatore Marconi, when, in the year 1900, he started on his self-appointed task of signalling across the Atlantic. When one takes into consideration the embryonic state of the art of that date, and the magnitude of the task undertaken, one can only marvel at the rapidity with which Senatore Marconi scored his initial success and afterwards developed it to a stage where it became of world-wide importance.

THE RECTIFICATION EFFECT IN ITS RELATION TO THE COMPOSITION AND STRUCTURE OF CRYSTALS.

By H. M. Dowsett, M.I.E.E., F.Inst.P.

In the *Radio Review* for November, 1921, the author has shown that all the experimental evidence indicated that the rectification effect of carborundum is due to its particular crystal structure.

This conclusion derives additional support from the fact that no current whatever flows through a good rectifying point of green positive carborundum within the range of applied EMF + 0·2 volts to − 2.0 volts or through a good rectifying point of black negative carborundum within a similar range of − 0·2 volts to + 2·0 volts, the crystal under such conditions behaving like a perfect insulator so that no thermo-electric effects can take place until this range, which is asymmetric as regards zero, is exceeded. But it is this asymmetry which produces the rectification effect. Also it is clear that the limiting values of this range are of an order that no electrostatic, polarisation, or photoelectric effect could account for. These other effects all modify the shape of the characteristic to some extent and in varying degrees, but with carborundum their influence is so subordinate to that of crystal structure that it may be neglected.

But in the case of mineral rectifiers such as molybdenite which conduct for the smallest applied EMF, the thermo-electric, polarisation and every other effect must play a much larger part than with carborundum, and it is more necessary to demonstrate that it is the composition and structure of the crystal itself which are the determining factors in rectification.

In the first place, G. W. Pierce* has shown as the result of much careful experimental work that the thermo-electric effects associated with molybdenite although very pronounced, do not produce sufficient heat to account for the rectification effect.

In the second place, the examination of carborundum previously referred to showed that one form of crystal structure—the tabular hexagonal green variety—always rectified in the positive sense, and that a very different form of crystal structure—the flake hexagonal black variety—always rectified in the negative sense; in the first case the base of the crystal had to be connected to the positive pole of the battery, in the second case to the negative pole in order to obtain the greatest current for a given applied EMF.

This association of crystal structure with a definite direction of rectification is a fact of some importance.

There is a grade of carborundum in which both positive and negative rectification are found, but in this case the crystal structure is not homogeneous, it is graphitic and contains more impurities.

Now in molybdenite the rectification effect varies in degree, but it always has the same sense. Thus Figs. 1 (*a*), (*b*) and (*c*), redrawn from Figs. 125, 126, 127 in Prof. Pierce's book shows the characteristics of negative crystals, Fig. 2 gives a number of characteristics of molybdenite detectors which came under the observation of the writer in 1916, all of which are negative, and Fig. 3 shows some characteristics taken recently, again all negative.

Molybdenite is a rare mineral, and it has therefore not been possible to examine large quantities of it as was done with carborundum, but the

* "Principles of Wireless Telegraphy." By Prof. G. W. Pierce. (*McGraw-Hill Publishing Co., Ltd.*; 1910. Page 198.)

evidence appears to be sufficient to show that molybdenite which has but one crystal form—a hexagonal flake, sometimes foliated, the flakes occasionally

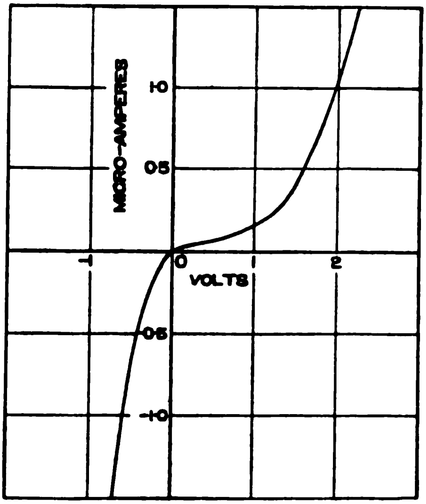

Fig. 1(*a*).

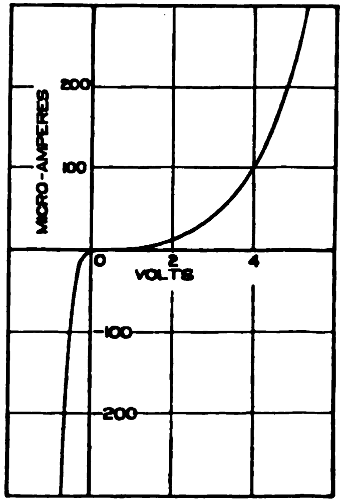

Fig. 1(*b*).

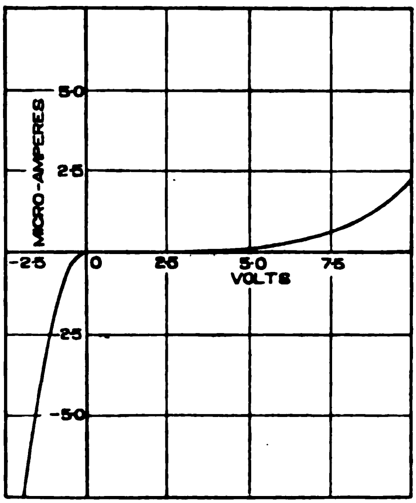

Fig. 1(*c*).

Figs. 1(*a*), 1(*b*) *and* 1(*c*).—*Characteristic Curves for Molybdenite* (*G. W. Pierce*).

but very rarely forming hexagonal prisms—rectifies correspondingly in one direction only for all crystals.

The chemical formula for molybdenite is **MoS_2**, its atomic arrangement being **S=Mo=S**. Thus a positive element is held by two negative

elements, and most probably between them, a grouping which one might reasonably expect to have some influence in imparting an electro-negative character to the crystal structure. No doubt the atomic arrangement does exist in this respect in the case of molybdenite, although, as illustrated later on, by the behaviour of some other crystals of similar chemical formula, the position of the positive element in the molecule does not by itself determine whether the crystal shall show a positive reaction or a negative. Thus the evidence provided by molybdenite alone is confirmatory, but not conclusive as to the part played by crystal structure and composition.

Let us now examine the crystals of some other minerals.

Galena, **PbS** for example, crystallises in cubes and octahedrons and shapes developed from these two forms. All the samples tested on a recent occasion ossessed what is usually called a rising characteristic, but none of them

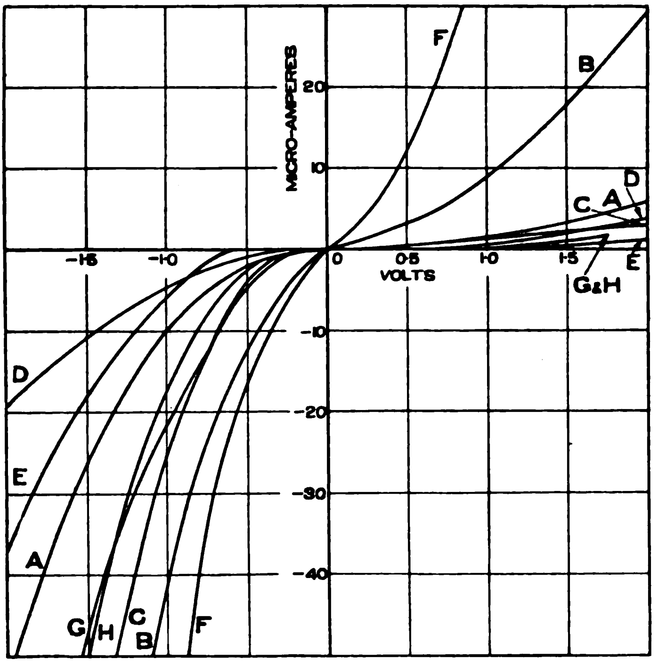

Fig. 2.—Characteristic Curves of Molybdenite.

Specimens A, B, C, mounted in "Wood's Alloy."
Specimens D, E, F, G, mounted on upper surface only with "Wood's Alloy."
Specimen H mounted in special screwed cap.

rectified—that is, the slope of the curve at every point on the positive side of zero EMF was identical with the slope on the negative side. Fig. 4 gives a typical characteristic of about 30 samples. As a rectifier then galena has a neutral character.

Iron Pyrites **FeS$_2$** also crystallises in cubes, but with striated faces and in octahedrons. The characteristics of two distinct varieties, one of them having a bright highly polished appearance, the other being a dull crystal, are given in Fig. 5 and Fig. 6. These crystals all show positive rectification, but not of a pronounced order. It will be noted that the atomic arrangement is similar to that of molybdenite.

The characteristics of samples of Iron Sulphide Fe_7S_8, Fig. 7—which usually occurs in irregular masses and very rarely in hexagonal crystals—are similar to the above but of higher resistance.

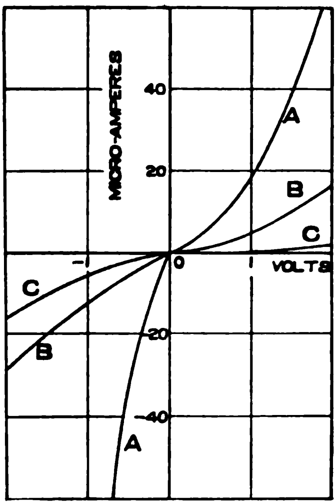

Fig. 3.—Characteristic Curves of Molybdenite.

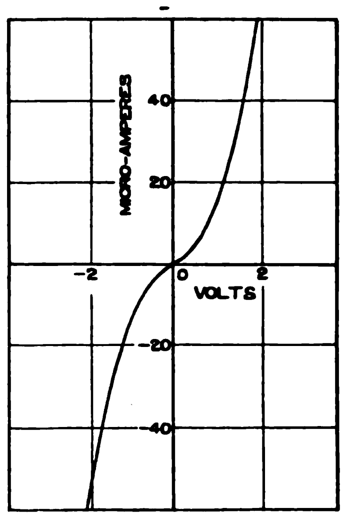

Fig. 4.—Typical Characteristic Curve for Galena.

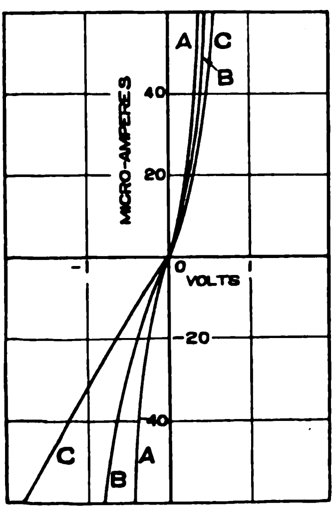

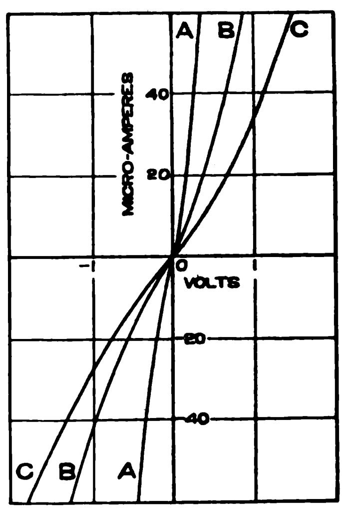

Fig. 5.—Characteristic Curves for Bright Iron Pyrites.

Characteristic Curves for Rough Iron Pyrites.

As a final example we may take Zincite, **ZnO**, which crystallises in the hexagonal form. Crystals of this mineral are consistently and decidedly positive, as shown in Fig. 8.

Thus molybdenite is the most negative of the crystals named, galena is neutral, iron pyrites is feebly positive, and zincite is decidedly positive, *and this is the same order in which the corresponding metals molybdenum, lead, iron, and zinc occur in the electro-chemical table of the elements.*

The rectification effect, therefore, so far as it concerns the relative strengths of the two currents which under the influence of a given EMF can be made to flow through sensitive points on the crystals mentioned, first in one direction and then in the other, clearly depends on the electro-chemical nature of the positive ions in the compounds. Having established this point, the dependence of the rectification effect on crystal structure is also established as the actual position of these positive ions must also be of importance.

It has been shown in the case of carborundum that it is only the position of the surface ions which matter, as the electrostatic and magnetic fields of all the interior molecules forming the crystal hold them in a rigid, though elastic state. The outer molecules must possess more freedom than the inner ones and all we need to assume is that each molecule possesses a conducting

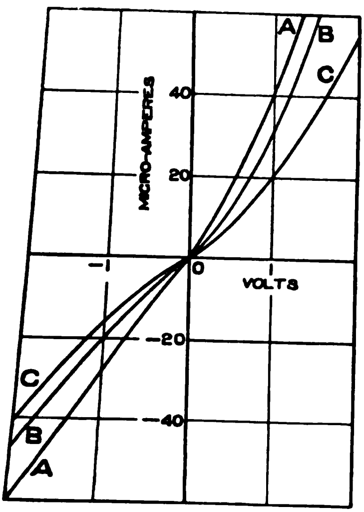

Fig. 7.—Characteristic Curves of Iron Sulphide.

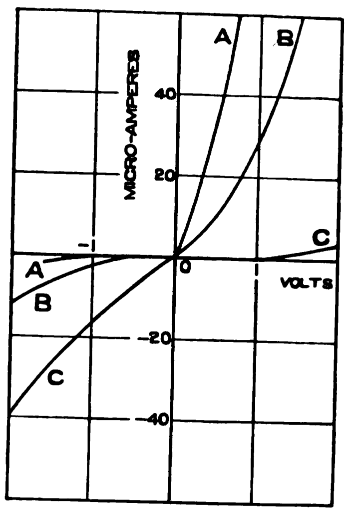

Fig. 8.—Characteristic Curves for Zincite.

axis, and that the applied electrostatic field reacts with the internal fields to produce an axial distortion in the outer molecules which improves conductivity and gives the crystal its rising characteristic. The carborundum molecule would appear to have its conducting axis parallel to the crystal face, as the crystal is a perfect insulator for low values of applied EMF, but as a current flows with minimum applied EMF through the rectifying points of all the minerals we have now discussed, the molecular axis in each case must already be inclined at some angle to the crystal face, and the applied EMF increases this inclination until that stage is reached at which the characteristic assumes a straight line character.

A wide area contact over a broken surface provides paths at all angles into the crystal network, molecular distortion is then unnecessary, and therefore no rectification effect results.

VALVE PATENTS FOR 1921

No. **137,271.** By E. H. Armstrong.

In order to obtain a satisfactory effect from a detector it is necessary that the strength of the signal should not fall below a certain value, otherwise the response of the detector is so feeble that even with the assistance of L.F. amplifiers the signals cannot be made readable. The only remedy, therefore, in the case of weak signals is to apply H.F. amplification. However, this can be carried out efficiently only if the wave is not too short. For frequencies corresponding to a wavelength of about 100 metres the internal capacity of the valve acts as a shunt of comparatively low impedance, and therefore amplification becomes almost impossible. Obviously the difficulty would be overcome if we could manage to convert a short wave into a longer one, for which efficient amplification can be carried out. According to the invention, this reduction of the frequency is obtained by heterodyning in one or several stages.

An arrangement of circuits for this purpose is shown in Fig. 1. Suppose the oscillations arriving at 31 are of a frequency 10,000,000. They are passed on to circuit 32–33 tuned to this frequency and combined with the oscillations produced by a local generator 34 of a frequency 11,000,000. After rectification by detector 35, a frequency 1,000,000 is obtained. This is amplified by 38, and then combined with a frequency of 1,100,000 produced by the local generator 40. After rectification a frequency 100,000 is obtained, which is amplified by 43. The last current is rectified and indicated by 44 and 45 respectively.

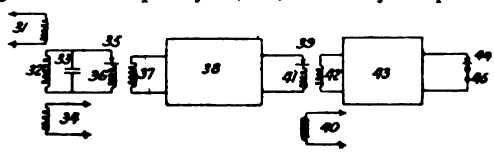

Fig. 1.

No. **139,494.** By M. I. Pupin.

It is well known that the amount of amplification, especially in the case of high frequency, is limited by the internal disturbances in the tube (besides other causes), mainly due to the unsteadiness of the current during operation. The disturbances which are of a comparatively low frequency are amplified, and render the operation of the amplifying system unsatisfactory if the number of valves exceeds a certain limit.

In order to overcome this difficulty, it is proposed to split up the system into sections, each of which contains only three or four valves, connected in cascade in any manner. The sections are interconnected by a conductor, consisting of capacities and resistances, or of resistances and inductances. Such a conductor is illustrated in Fig. 2 by 23, 24, 25, 26, 27, 28, 29. By a

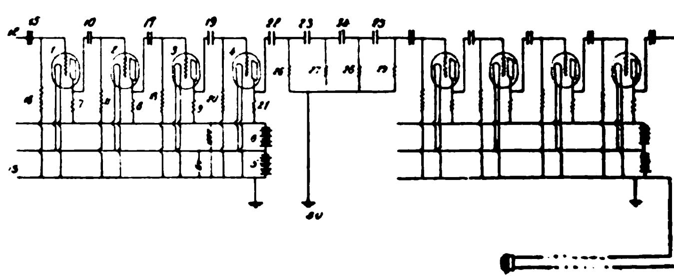

Fig. 2.

proper choice of the elements of the compound conductor (or, as it is called in the specification, "pilot-conductor"), the attenuation for H.F. currents will be very much smaller than for L.F. currents. It follows that while the H.F. oscillations are handed on from one section of amplifiers to the next without being weakened to any noticeable degree, the low frequency disturbances are almost entirely eliminated by the "pilot-conductor."

No. **139,514.** By Westinghouse Lamp Company (assigned by H. C. Rentschler).

Consider the three-electrode valve (Fig. 5) filled, say, with argon (or with certain metallic vapours) at a pressure which may be anything between a fraction of a millimeter and several millimeters of Hg. The filament 5 is heated to emit electrons. The screen 6 is kept at a positive potential. The electrons move towards the screen and, on their way, come into collision with the gas particles. The result of this impact will depend on the velocity of the electrons at the moment when the collision takes place. All other conditions being given, there is a definite critical speed at which the impact becomes non-elastic, that is to say, after the impact the velocity of the original electron becomes greatly reduced, while the secondary electrons, which may be produced, are also of a small velocity. At velocities smaller than the critical, the electron shoots through the gas particles or rebounds from them as in the case of elastic impact, maintaining its original speed.

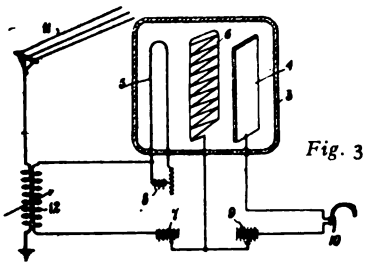

Fig. 3.

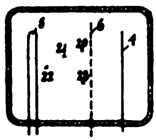

Fig. 5.

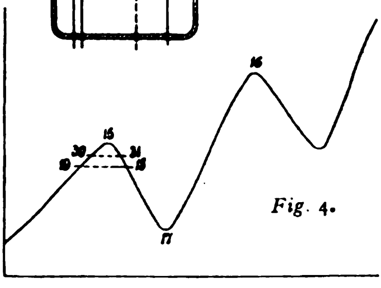

Fig. 4.

Let us now assume that the screen is kept at a rather low positive potential. The acceleration of an electron starting from the filament will be small and its velocity, when near the screen, will still be less than the critical, but at the same time will be high enough to reach, in the event of its escaping through the mesh, the plate, notwithstanding the fact that the latter is kept at a potential negative relatively to the screen. If we now increase the screen potential, it is possible that the velocity of the electron will reach the critical value just before it arrives at the screen, say, at a point 20. As explained before, electrons with a small velocity will be produced, which will be absorbed by the screen, since the negative potential of the plate is sufficient at such small velocities to repel them back to the screen. If the screen potential is increased further, the critical velocity will be reached at a point more distant from the screen, say, at 21. In this case, the slowly-moving electrons resulting from the impact may acquire, by the time they arrive at the screen, a velocity sufficiently high to overcome the repulsion of the plate, and thus reach the latter. At a still higher screen potential, the electrons may reach the critical velocity when quite near the filament, say, at a point 22. By the time the electrons, which start after the impact with a small velocity from 22, arrive near the screen, say, at a point 23, they may again reach the critical velocity. The electrons produced after

the second non-elastic impact, even if they escape through the mesh, are repelled back to the screen by the plate, owing to their small velocity. With a higher screen-potential, the second non-elastic impact will take place farther from the screen, so that the electrons will have again recovered their speed by the time they arrive at the screen, and will therefore reach the plate. A further increase of the screen may lead to three non-elastic impacts between filament and screen, and so on.

It will be seen that the number of electrons reaching the plate (and thus the plate current) will at first increase with the increase of the screen potential. At a certain value of the latter a maximum will be reached. On the further increase of the screen potential, non-elastic impacts near the screen begin to take place, and the current diminishes until a minimum is reached. If the screen potential is further increased, the current begins to increase, for the non-elastic impacts will now take place sufficiently far from the screen, and so on.

The whole process is represented by the diagram shown in Fig. 4, where the absissæ and ordinates represent screen-potential and plate-current respectively. The phenomena described above may be utilized for reception in the manner shown in Fig. 3. It will be easily seen that if the valve is adjusted (by means of batteries 7, 9) to point 15 (see Fig. 4), an oscillating voltage applied between filament and screen will lead to a decrease in the mean value of the plate current. (In Fig. 4 a case is shown when the amplitude of the incoming oscillation is roughly represented by one-half of the line 18 – 19. The mean value of the plate current will then be represented approximately by the ordinate of any point on line 30 – 31).

No. **139,518.** By Westinghouse Lamp Company (assigned by H. C. Rentschler).

This is a patent of addition to No. 139,514 and covers a valve in which the effect of non-elastic impact at the critical velocity between electrons and gas particles is enhanced by utilising the secondary emission of electrons from the plate, as in a "dynatron." The claim reads as follows :—

"An electron tube, as claimed in the Patent Application No. 5899/20 (No. 139,514), characterised by such an adjustment of the electrode spacing and the relative potentials there-between, that the maximum variation of plate electrode current due to resonance potential occurs at a screen electrode potential which corresponds with the maximum variation of plate electrode current due to electron reflection or secondary emission, so that extremely sensitive operation is obtained."

No. **140,449.** By Western Electric Co., Ltd. (assigned by E. O. Scriven).

The specification discloses arrangements for securing in the output circuit of a generating valve oscillating currents of constant amplitude and frequency, and also for utilising the valve as a generator of several frequencies which are multiples of the fundamental.

In Fig. 6 valve 4 is a generator, owing to the coupling 5–6 between its plate and grid circuits. The anode battery 10 is connected in series with resistance 13. The value of the latter is made so high that the anode current is substantially constant. Any small fluctuations in the internal resistance of the valve, brought about by the substitution of one valve by another possessing approximately the same dimensions and the same degree of vacuum, will not affect, therefore, the value of the space-current.

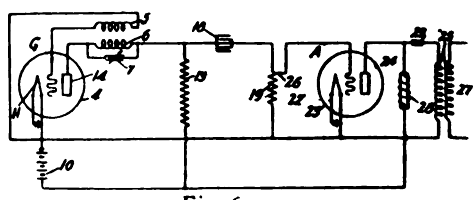

Fig. 6.

For the same reason, small variations of the anode voltage or of the electrical values of other elements of the circuit, due to the conditions of oscillations, will have only a negligible influence on the intensity of the space current. Owing to this, the amplitude and frequency of the generated oscillating current will also be maintained constant.

The H.F. oscillations will flow mainly through the large condenser 18 and small resistance 19. The voltage drop across the latter (which possesses no D.C. component, owing to the insertion of condenser 18), is applied between grid and filament of amplifying valve 24. The high inductance 28 provides a path for the D.C. from battery 10, while condenser 29 prevents the latter from being short-circuited through the primary winding of the transformer 25.

Turning now to Fig. 7, it will be noticed that the path for the H.F. oscillations is formed here by condenser 33 and an inductance 32 (instead of a resistance 19, as in Fig. 6) provided with an iron core. The impedance of this path will therefore depend on the frequency of the oscillations. As the A.C. generated by the valve are not of a pure sinusoidal form, the higher harmonics, notwithstanding their small amplitude as compared with that of the fundamental wave will, nevertheless, produce an appreciable voltage drop across 32, owing to the fact that the impedance of the latter increases with the increase of frequency. After amplification by valve 36 the compound wave is passed on by means of transformer 39 to circuits 42–43, 48–49, etc., tuned to frequencies *f*, 2*f*, 3*f*, etc., *f* being the fundamental frequency generated by valve 4. It is obvious that each of the circuits possess only that frequency to which it is tuned; therefore, currents of frequencies *f*, 2*f*, 3*f*, etc., will be produced in circuits 45, 50, 52, etc., respectively.

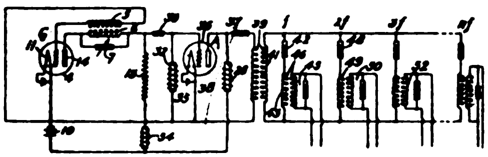

Fig. 7.

No. **141,046.** By WESTERN ELECTRIC CO., LTD. (assigned by R. V. L. Hartley).

Consider the oscillatory circuit 2–3–4 (Fig. 8), in which the condenser 2 is shunted through batteries 9 and 10 by the grid-anode path 8–7 of valve 5. Suppose that at any moment the oscillatory current is flowing in such a direction that terminals 13 and 14 are negative and positive respectively. This will mean that the potential of grid 8 will become more negative, the internal resistance of the valve will become higher, and therefore the voltage drop across 6–7 will also be increased. In other words, the positive potential of the plate will become higher, and, owing to the amplifying properties of the valve, the increment of the plate voltage in the positive sense will be much greater than the increment of the grid potential in the negative sense. Thus the positive charge on coating 14 will be increased, and as it is in phase with the oscillatory current, since we have assumed the latter to flow from 14 to 13, there will result an increase in the energy available in the oscillatory circuit 2–3–4, which will compensate for the losses due to resistance and other causes. On the reversal of the oscillatory current, a reasoning similar to the above, will show that the negative charge on coating 14 will increase, thus leading again to an increase in the oscillating energy, since the current is

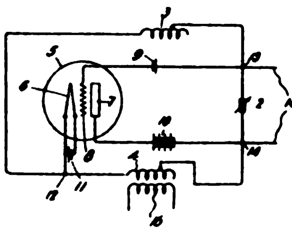

Fig. 8.

now flowing from 13 to 14. It will be seen that the valve, owing to its amplifying properties, supplies energy to the circuit 2–3–4, and if that supply is sufficient to make good the losses, the oscillation once started will maintain itself.

Another way of explaining the generating properties of the arrangement consists in considering the couplings existing between grid and plate circuits. Indeed, on one hand the plate circuit 7–10–14–4–12 is coupled through inductance 4 to oscillatory circuit 2–3–4; on the other hand, the latter is coupled to grid circuit 8–13–3–12 through inductance 3. It follows that the grid and plate circuits, since each of them is coupled to a third circuit (2–3–4), are intercoupled, and therefore the arrangement, as in the well-known case of inductive reaction, should work as a generator.

The special advantage of this method of connection consists in the fact that the capacity between the plate and grid is swamped by the capacity of the parallel condenser 2, with the result that the capacity of the valve cannot " combine with the inductance to form a secondary oscillatory circuit, in which might be set up oscillations having a period different from that of the oscillations it is desired to generate."

No. **141,047.** By WESTERN ELECTRIC CO., LTD. (assigned by E. H. Colpitts).

This relates to a method of modulating by speech the H.F. currents generated by valves. As will be seen from Fig. 9, valve 1 will generate A.C., the frequency of which will depend on the values of the inductances 17 and 14 and the capacity of condenser 18, which elements constitue the grid circuit coupled to the anode circuit through 17 and 4. The high inductance 11 provides a path for the D.C. from battery 10, forming at the same time a very large impedance with respect to the H.F. oscillations. Condenser 8 and 9 cut off the D.C. from coils 3 and 4. For the purpose of modulating the amplitude of the H.F. oscillations in sympathy with the sound vibrations imparted to the diaphragm of microphone 24, the circuit of the latter is coupled by means of a transformer to circuit 19, which, in its turn, is coupled to the grid circuit. It is obvious that the amplitude of the normally generated oscillation (*i.e.*, when the microphone is not actuated) will increase if the potential of the grid is increased, owing to a positive impulse being imparted to it from the microphone circuit and *vice versa*.

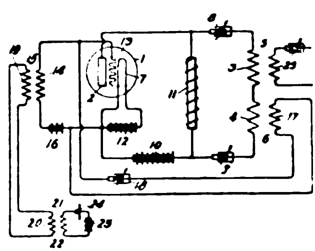

Fig. 9.

No. **141,706.** By SIEMENS-SCHUCKERTWERKE G.m.b.H.

For high-power valves there is, of course, necessary a large emission of electrons from the cathode. The latter has, therefore, to be made in such a way as to possess a large surface, and this involves the necessity of passing through the cathode currents of considerable magnitude. Above a certain limit, however, the sealing into the glass container of the leads, which for large currents have to be of a large diameter, becomes very difficult. In order to overcome this disadvantage, it is proposed to use a cathode of a large surface, which is heated by the bombardment of electrons emitted from an auxiliary cathode brought to incandescence by passing through it a current. The construction of such a valve is illustrated on Fig. 10, where 6 is a filament, heated by a current supplied from battery 7 through resistance 8, 3 is the main cathode heated to a high temperature by the impact of the electrons emitted from 6, and 2 is the anode. In order to impart to the electrons a high velocity, which is necessary if their impact with 3 should result in the liberation of considerable energy sufficient for heating the comparatively

large surface of the latter, a battery 9 is employed for impressing a P.D. between 6 and 3. The advantages of the invention is illustrated in the specification by the following numerical example :—

" Let the auxiliary cathode 6 consist of a wolfram wire of 0·15 mm diameter, it then requires a heating current of about 4 amps. There is no difficulty in leading-in this current. Let the glowing cathode 3 consist of a wolfram cylinder of 0·15 mm thickness and 10 mm diameter. The current required for the direct heating of this glowing cathode would be 250 times as great as the current for the auxiliary cathode 6, and therefore would be about 1,000 amps. It would be quite impossible to lead-in such a current into glass vessels, and only with the greatest difficulty into metal vessels. When making use of the invention, the conditions are quite different. If the glowing cathode 3 is to be heated up to 2,000° C., it will radiate for every 1 cm of the dimensions given 314 watts. These are produced when the glowing cathode is irradiated by electrons, according to the invention, by the use of a voltage of about 630 volts in the auxiliary circuit 9, 10. This corresponds to a current of $\frac{314}{630}$ = approx. : 0·5 amp. for 1 cm length of cylinder of the cathode. For a length of 10 cm the current amounts to 5·0 amps., as compared with 1,000 amps with the direct heating of the cathode. It is thus brought about by the invention that even for a long glowing cathode the current in the auxiliary circuit is reduced to about the amount which corresponds to the heating current of the small auxiliary electrode 6."

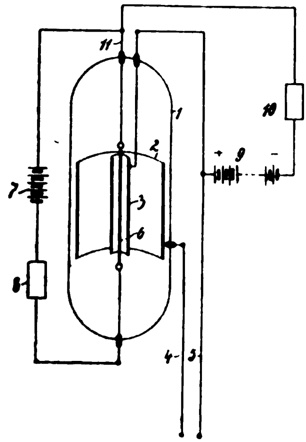

Fig. 10.

No. **141,782.** By WESTERN ELECTRIC Co., LTD. (assigned by H. J. van der Bijl).

Let us assume that between the grid and filament of an amplifying valve are applied simultaneously two alternating potentials of a high and low frequency respectively. In the plate circuit there will be obtained a current of the shape shown in Fig. 12. If this plate current is transmitted to a circuit tuned to the H.F., the current obtained in the latter will be represented by the graph shown on Fig. 13. We say that the H.F. current is modulated by the L.F. There are two conditions which must be satisfied if the modulation is to be of practical use. First of all, it must be perfect, and secondly, complete.

Perfect modulation implies that the variation of the amplitude of the H.F. current should be such that the line joining the points corresponding to the maximum values (or the envelope) reproduces exactly the shape of the L.F. potential impressed on the grid. As the H.F. oscillations shown in Figs. 12 and 13 are due to the amplification of the H.F. oscillations of constant amplitude applied to the grid, it follows that the degree of amplification must be variable. Moreover, the law of variation must be expressible by a linear function of the L.F. potential for otherwise the envelope cannot reproduce exactly the shape of the latter. Let us now consider the grid-voltage anode-current characteristic of the valve shown in Fig. 11. It is

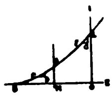

Fig. 11.

Fig. 12.

obvious that an increment in the grid voltage at a point C leads to a smaller increment in the anode current than an equal increment F G at point F, owing to the curvilinear form of the characteristic. The degree of amplification is proportional to $\frac{di}{dv}$ or to the slope of the characteristic at the considered point. According to the explanations given above, we must have for perfect modulation $\frac{di}{dv} = av$, where a is a factor of proportionality. On integration, we obtain:

$$i = av^2 + c,$$

i.e., the curve should be a parabola.

Further, in order that the degree of amplification should depend on the value of the L.F. potential at the considered moment, it is obviously necessary, since the potential of the grid is determined by the algebraic sum of the L.F. momentary values of the low and high frequency potentials, that the amplitude of the latter should be small in comparison with the former. Theoretically, the ratio ought to be infinity, but in practice a value from 3 to 10 gives fairly good results. Thus, for "perfect" grid modulation it is necessary that:

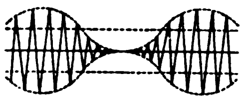

Fig. 13.

(i) The amplitude of the modulating oscillations should be considerably larger than that of the carrier H.F. oscillations, and

(ii) the shape of the valve characteristic should be parabolic.

The condition of "complete" modulation can be expressed by reference to Fig. 11, in the following manner. If M is the point about which the H.F. potential oscillates in the absence of the modulating L.F. potential, the amplitude of the latter should just be M B—that is to say, the plate current should be zero just for the moment when the grid reaches its maximum negative value. This is clearly necessary, for if the amplitude is larger than B M, a portion of the L.F. signal will be cut off; on the other hand, if the amplitude is smaller than B M, there will be an idle current.

The conditions deduced above from general considerations can be satisfied by the arrangement of circuits shown on Fig. 14; 15–16–17 is the microphone circuit, and 14 is the H.F. source. It will be seen that the potentiometer 10 allows of adjusting the ratio of L.F. and H.F. potentials applied between grid 5 and filament 3 of the amplifying valve 3.*

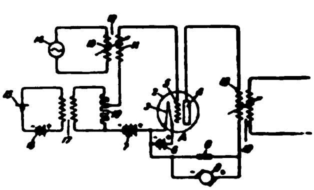

Fig. 14.

With regard to practical applications, the inventor says: "Since for complete and effective modulation it is desirable that the power value of the impressed telephonic wave shall be greater than that of the generated high-frequency oscillations, it will appear that the power value of the modulated high-frequency waves produced in the transformer 19 may well be insufficient for effective radiation from an antennæ. In such case the power may be amplified to the degree required for radiation in any well-known manner. On the other hand, it may well be that the high-frequency oscillations have a fairly large power to start with, and in this case it may be necessary to amplify the telephonic power before impressing the two upon a common amplifier."

* The parabolic shape of the characteristic is assumed by the inventor. See his article in the *Physical Review*. Page 171. September, 1918.

No. 142,474. By WESTERN ELECTRIC CO., LTD. (assigned by H. J. Vennes).

The specification covers a method of producing harmonics by means of an overloaded valve. The principle is illustrated in Fig. 15, where 3 is the well-known grid-voltage anode-current characteristic of a valve, 4 a sinusoidal voltage applied between filament and grid, and 5 the curve of the anode current. It is obvious that owing to the bend A, the upper half of the curve 5 (provided the amplitude of the applied E.M.F. is large enough) will differ considerably from the sine form. On analysing such a curve it will be found that both even and odd harmonics are present.

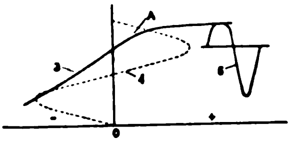

Fig. 15.

In order to make the method applicable to cases where the amplitude of the sinusoidal voltage impressed on the grid is rather small, it is suggested to employ a high resistance in the plate circuit. With the increase of this resistance, the ordinate corresponding to point A, at which the curve bends, will decrease. This is obviously true, because the potential drop across plate-filament of the valve decreases with the increase of the external resistance in the plate circuit, and it is well known that the bend in the characteristic occurs at lower and lower values of the anode voltage as the plate voltage is diminished.

No. 143,262. By WESTERN ELECTRIC CO., LTD. (assigned by P. Schwerin).

In valve generators the heating of the anode, due to the bombardment by the electrons emitted from the filament, may become so high with the increase of the power output that sometimes the plate is melted. In order to overcome this difficulty it is proposed to form the anode of a tube projecting into the bulb and communicating with the atmosphere. The excessive heat can then be dissipated by means of a cooling fluid circulating through the tube.

One construction of a valve, according to the invention, is shown in Fig. 16, where 5–6 is the anode, 3 the grid and 2 the filament.

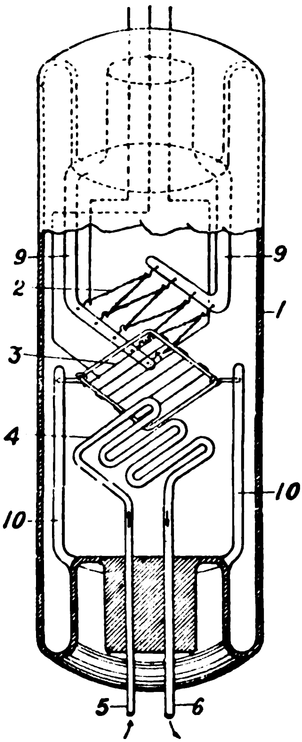

Fig. 16.

No. 144,690. By W. C. HERAEUS G.m.b.H.

This is a patent of addition to No. 138,648, in which "there is described and claimed a process for the manufacture of metal and metal alloys, which process consists in melting the metal or alloy in a gas-tight electric furnace below atmospheric pressure, exhausting the furnace to produce a high vacuum therein, continuously applying heat to the furnace and exhausting the gases therefrom until, with the furnace hermetically closed, no increase of pressure therein is observed."

"According to the present invention this process is applied to the production of metal and metal alloys for the manufacture of parts of vacuum tubes."

"In carrying out the process it has been found that such metals or the like, when rolled into sheets or drawn into wire, or when rendered incandescent in the presence

of any gases, such as hydrogen, will no more absorb noxious quantities of gases and will therefore give no cause for trouble in making the hereinbefore-mentioned tubes."

No. **145,630.** By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE, M.B.H.

The invention relates to a method of suppressing the tendency to oscillate of an amplifying system consisting of several valves connected in cascade. The claim reads as follows :—

"A thermionic tube amplifier comprising a plurality of thermionic tubes, arranged in cascade, characterised by the feature that the intertube transformers are metal sheathed substantially as and for the purpose set forth."

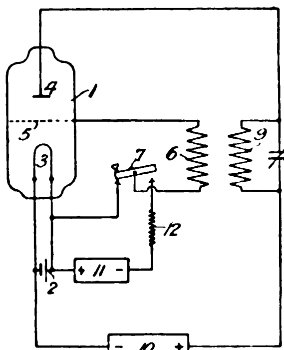

Fig. 17.

No. **147,429.** By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE, M.B.H.

In order to avoid excessive heating of the anode in valve transmitters, it is desirable that the load should be switched off during the intervals between successive signals. The obvious solution of placing the key in the H.T. supply is inadmissible, owing to the sparking which would result from such an arrangement. It is proposed therefore, to place the key in the grid circuit in the manner shown in Fig. 17. It will be seen that when the key is depressed a negative potential is impressed on grid 5 by battery 11. The value of this potential is chosen sufficiently high to prevent the valve from oscillating. On the other hand, when the key is in signalling position, the battery 11 is disconnected and the valve may oscillate.

No. **147,850.** By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE, M.B.H.

It is well known that the H.F. oscillations produced by a valve are not pure ; that is to say, besides the fundamental there are also present harmonics. It is important that the latter should be prevented from reaching the antenna and thus being radiated. It is proposed to use for this purpose

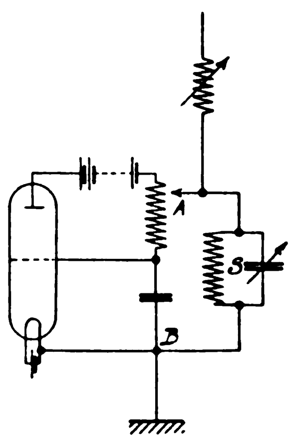

Fig. 18.

rejector-circuits in the manner shown in Fig. 18. (The valve generates in virtue of the capacity-coupling between the grid and plate circuits. The plate circuit is formed by the antenna-earth system.) The circuit S is tuned to the fundamental frequency, and will therefore present an almost infinite impedance against currents of such frequency. On the other hand, currents of different frequencies, such as those due to the harmonics, will be short-circuited by S. It follows that, while the fundamental wave reaches the antenna without loss, the harmonics get absorbed and are not radiated Instead of connecting the rejector circuit in parallel to the circuit formed by the antenna and the earth, one or more circuits, tuned to the frequencies of the main harmonics could be inserted in series with the antenna.

No. **152,865.** By British Thomson-Houston Co., Ltd. (a communication from G.E.C. of America).

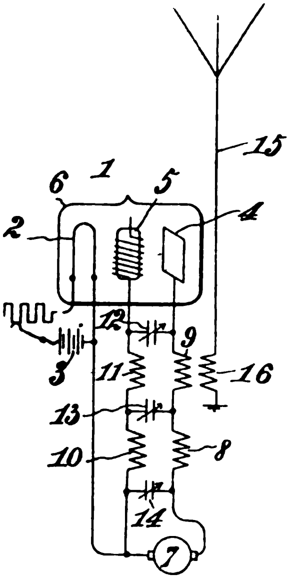

Fig. 19.

The object of the invention is to provide a valve transmitter which would send out either tonic trains of oscillations or two waves differing only slightly one from the other. In either case the necessity of a local source of oscillations at the receiving end for the purpose of heterodyning is obviated. The method of connection is illustrated in Fig. 19. The oscillations (due to the capacity inserted between grid and plate) are produced in circuit 11–12–9–13, on one hand, and in circuit 10–13–8–14, on the other. The latter circuit may be tuned either to an audible frequency or to a high frequency only slightly differing from that of circuit 11–12–9–13. In the first case, the low frequency serves to modulate the H.F. oscillations radiated from the antenna 15. In the second case, both frequencies combine to give beats, which can be detected as an audible note at the receiving station. As to the *modus operandi*, the following statement is made in the specification : —

" Because of the complexity of the current and voltage conditions in the circuits which are arranged in this way, it is difficult to state precisely the manner in which it operates."

No. **152,693.** By J. Scott-Taggart.

The invention relates to a method for producing negative resistance by means of a combination of two valves suitably interconnected.

In Fig. 20 is illustrated an arrangement which exhibits the fundamental idea. Let us assume that, owing to a P.D. applied at D, the potentials of plate 3 in valve A and of grid 5 in valve B become both higher. It follows that the plate-currents of both valves become larger. Owing to the increase of current in the plate circuit of valve B, the potential drop across resistance F will also increase. As resistance F is connected between filament 1 and grid 2, the P.D. between these electrodes will also increase. Taking into account the direction of the anode current of

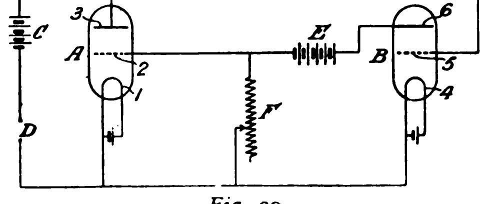

Fig. 20.

valve, it will be easily seen that grid 2 becomes more negative relatively to filament 1, and that, in view of this, the current in the plate circuit of valve A decreases. Thus the application of a P.D. at D results in an increase of current on the one hand, and a decrease on the other. If the latter factor is made to predominate the former—which can easily be done—an increase of P.D. between the filament and plate of valve A leads to a decrease of current flowing between these electrodes, or, in other words, the arrangement acts as a negative resistance.

No. **153,681.** By J. Scott-Taggart.

The invention relates to a method of utilising a valve with two grids for reception. In the Fig. 21 circuit 2–3, tuned to the frequency of the oscillations received by aerial 1, is connected across filament 5 and grid 6. Amplified oscillations will therefore arise in anode circuit 11, which is coupled to circuit 15–14, connected between grid 18 and filament 5. Owing to the presence of the condenser 16, shunted by high resistance 17, the oscillations are rectified and then magnified in plate circuit 11, where they will be heard in telephone 13. If the oscillations to be received are continuous, the circuit 15–14 may be tuned to a frequency slightly differing from that of the signals. Beats will then be produced, and, after rectification, a musical note will be heard in telephone 13. It is pointed out that the closed circuit 2–3, coupled to the aerial, is tuned to the frequency of the incoming wave, while in most heterodyne arrangements this circuit has to be mistuned, which leads to weaker signals. Another use of the described circuit is suggested by the inventor, as follows :—

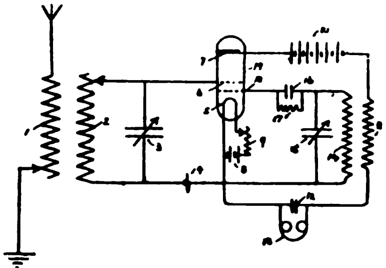

Fig. 21.

"It will be seen that the grid 6 is used for amplifying, while the grid 18 is used in connection with the rectifying process. It may, however, be desirable to eliminate 16, 17 and 13, 12, and use the second grid 18 also in an amplifying manner, the oscillations in 11 being unrectified and capable of being passed on to a detector or further amplifying devices."

"It may be desirable, to get the best results, to couple a portion of either 14 or 11 to either 2 or 1."

No. **153,690.** By J. Robinson, A. K. Macrorie, G. P. Grenfell and H. Morris-Airey.

In Fig. 22, valve 3 is generating oscillations owing to the coupling between the plate and grid circuit. The condenser 6, inserted in the latter, is shunted by the plate-filament path of valve 8. It is well known that if the negative charge accumulating on the grid of a generating valve cannot leak away sufficiently quickly, the oscillations are split up into groups. The frequency of these groups will be determined by the value of the resistance, which is usually connected in shunt to the grid condenser In the present case the value of the shunting resistance will depend on the intensity of the signals supplied from circuit 14–12–13 to the grid circuit of valve 8. It follows that the pitch of the note heard in telephone 15 will vary with the variation of the strength

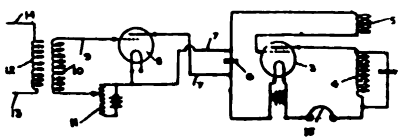

***Fig.* 22.**

of the signals. As to the application and the advantages of the described arrangement, the inventors make the following statement :—

"It will be seen that as the resistance is raised the pitch of the note will diminish, and *vice versa*. Hence, on the reception of signals the usual thing will be for the pitch of the note to be raised."

"It is well known that the ear is more sensitive to differences in pitch than it is to differences of intensity. Hence the advantages to be obtained from a system as above described are numerous."

"One of the outstanding advantages would be in directional reception, in which the pitch of the note in the receiver would depend on the orientation of the direction-finding coils."

"A further advantage presented is, that a system as above described will work satisfactorily for both continuous wave and spark reception, without necessitating any alteration in connections."

No. **154,982.** By H. J. ROUND.

Consider Fig. 23, in which P is the plate and F the filament of a valve For the sake of elucidating the idea we have assumed that the electronic current flowing from the plate to the filament is uniformly distributed over the former. From each of the four sections 1, 2, 3 & 4, into which we have divided the plate, a current $\frac{I}{4}$ is flowing to the filament, I being the total electronic current. If the negative pole of the H.T. battery B is connected to the negative pole of the filament battery b, we shall obviously have the currents $i + \frac{I}{4}$, $i + \frac{I}{2}$, $i + \frac{3I}{4}$ and $i + I$ flowing in the first, second, third and fourth sections of the filament respectively (counting from left to right). Where the electronic current is comparable with the heating filament current, such non-uniform distribution is very inconvenient, as certain sections of the filament are overloaded, while others are not sufficiently utilised.

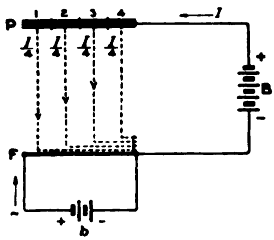

Fig. 23.

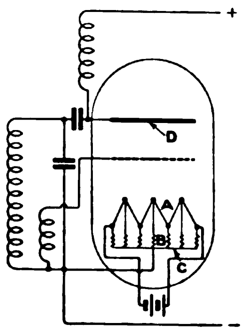

Fig. 24.

In order to overcome this difficulty, it is proposed to sub-divide the filament in the manner shown in Fig. 24. Here the filament A of a valve (shown as connected for generation) is divided into equal portions, each of which is shunted by two resistances of such magnitude that the portion is not short-circuited. The ends of the several resistances remote from the filament are joined together, and the common terminal is connected to the negative pole of the H.T. supply.

It will be seen that, with this arrangement, the electronic current of each portion of the filament is conveyed through the resistances shunting it direct to the terminal of the H.T. supply. The distribution of current along the filament will therefore be more uniform than with the ordinary arrangement, where the electronic current of one portion has to flow through the other adjacent portion.

No. **155,642.** By E. W. B. Gill.

The combination of two valves interconnected, as shown in Fig. 25, has been found by the inventor to give the curve shown in Fig. 26, where the abscissæ and ordinates represent the P.D. between filament F and grid G and the values of current in circuit of anode *a* respectively. It will be noticed that there are two rectifying points, L and M. The arrangement can be used either as a limiting device or for discriminating between different types of signals.

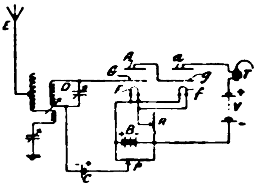

Fig. 25.

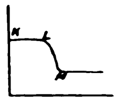

Fig. 26.

With regard to the former application, assume the working point is adjusted to coincide with L. Then, on the arrival of an oscillation, its negative half-cycle will lead to no change in the current passing through telephone T to anode *a*. On the other hand, the positive half-cycle will change the anode current, but this change remains the same for all oscillations with an amplitude exceeding the one determined by the abscissa corresponding to point M.

As to the second application, the inventor says: "Between the two rectifying points L and M signals go to a minimum, and it has been found experimentally that the positions of these minima differ for different types of sending gear. Thus, the minimum for a Telefunken is not the same as for a British Navy spark, and it is possible, if their strengths are about the same, to hear the Telefunken only on one adjustment and the Navy only on a near adjustment. Disturbances due to certain types of "atmospherics" can also be reduced relatively to the signals it is required to receive."

No. **155,854.** By W. H. Eccles and F. W. Jordan.

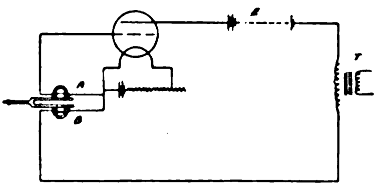

Fig. 27.

With the usual circuits employed in connection with geneating valves, the use of large capacities and inductances is unavoidable if the frequency of the oscillations to be produced is rather low. By the method of coupling between the plate and grid circuits, described in the present specification, this difficulty can be overcome. As shown in Fig. 27, "a tuning fork is so arranged that two electro magnets act upon its prongs, one being in the plate circuit and the other in the grid circuit of the triode. The movement of the grid prong induces E.M.F. in the grid coil A, and this controls the plate current, which, in its turn, on traversing the plate magnet B in the correct sense, sustains the motion of the fork."

Several applications of the principle are shown in the specification.

No. **159,955.** By H. L. Crowther and W. Makower.

The subject of the invention is clearly stated in the claim, which reads as follows:—

"In the process of exhausting gas from the electrodes of a thermionic valve or vacuum tube, heating one or more of the electrodes by currents induced directly therein by an inductance through which high-frequency current is passed, substantially as described."

No. **159,984.** By H. J. Round.

The invention relates to valves with several grids. By properly adjusting the potential of the various electrodes, such a valve can be utilised for performing several operations in one tube, as, for instance, magnification and rectification, or multiple magnification and rectification, etc. The main advantage of the device consists in the saving of energy, which is obtained owing to the fact that instead of several, only one filament has to be heated.

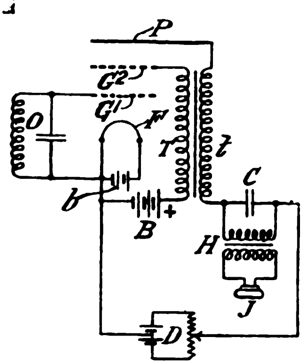

Fig. 28.

Out of the several embodiments of the invention shown in the specification only the following two will be described.

In Fig. 28 is illustrated a method of using a valve with two grids for the purpose of obtaining magnification and rectification. The tuned circuit O represents the source of the H.F. incoming oscillations. The positive pole of the H.T. battery B is connected to grid G^2, which serves as anode. It is clear, therefore, that the system F G^1 G^2 will work as an amplifier for the H.F. currents. By means of transformer T t an alternating potential will be induced between P and F. Current will therefore flow in circuit P t D F only at the moments when the potential of P is positive with respect to F. In other words, the system consisting of the filament F and plate P will behave as a Fleming valve and rectify the magnified oscillations. The potentiometer serves for adjustment to the rectifying point. The rectified signals will be heard in the telephone J, which could, however, be placed in circuit G^2 T B instead of being in circuit D t F.

In Fig. 29 a three-grid valve is shown. The incoming H.F. oscillations in circuit O are impressed by means of transformer Q between G^1 and F. Magnified current will flow in circuit G^2 B F grid G^2 serving as anode. By means of transformer Q^1, a magnified P.D. is impressed between G^3 and F, and second magnification takes place in circuit PBF.

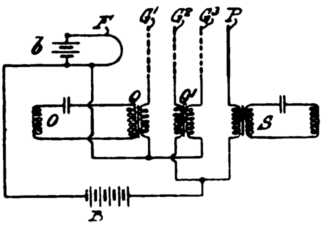

Fig. 29.

Another method of using the same tube is shown in Fig. 30. Here the incoming oscillations from circuit O are impressed between G^3 and F. They are magnified in PBF and then impressed through a transformer between G^1 and F. The second magnification will take place in G^2 B F.

If four grids and plate are taken, double magnification and rectification

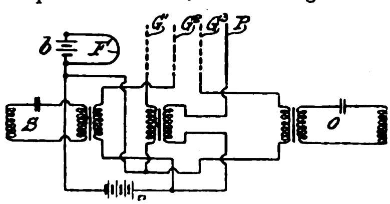

Fig. 30.

could be performed in the same tube. We could further arrange to utilise the tube for a double magnification of the L.F. oscillations.

No. **161,115.** By H. L. Crowther and W. Makower.

For high-power valves, the electron emitting electrode has to be made large and the sealing of the leading-in wires into the container becomes, from the manufacturing point of view, very troublesome.

According to the present invention, it is suggested to heat the cathode in the manner shown in Fig. 31. Here the filament *a* is connected to a low-resistance coil *b*, wholly placed inside the container *c* and forming the secondary of a transformer, the primary *d* of which is placed outside the bulb. The winding *d* is fed from a high-frequency source. The currents

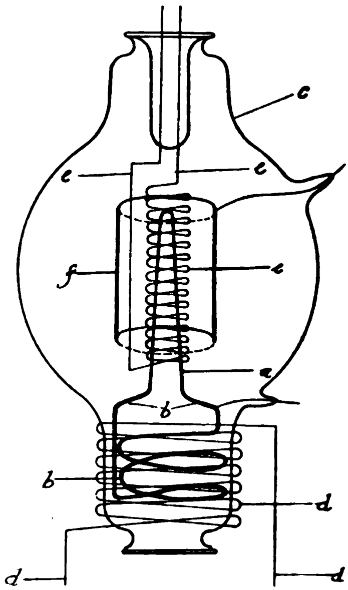

Fig. 31.

induced in the secondary are employed for heating the cathode. It will be seen that with this arrangement the necessity of having seals for the leading-in wires is wholly obviated.

No. **162,067.** By W. H. Eccles and J. H. Vincent.

In valve generators the length of the wave produced depends, *inter alia*, on the strength of the filamant current. All other conditions being constant, the wavelength (λ) will change with the variation of the filament current (i) according to the graph shown in Fig. 32. It will be noticed that the branch CD of the curve is rather flat, *i.e.*, comparatively large variations of i are accompanied only by small changes in λ. It is obvious, therefore, that where constant wavelength and amplitude (for it has been found that the amplitude grows with the wavelength) are of importance, the valve should be adjusted to work in the vicinity of point C. Now, the position of this

point with regard to *i* will depend on the degree of coupling between the plate and grid circuits. As the coupling is increased, point C is shifted to the right. Beyond a certain value of the coupling, therefore, the filament current corresponding to C becomes so large that the filament will burn out. It follows that in order to obtain the branch CD, it is necessary to choose a proper value of the coupling, and the inventors suggest the following procedure.

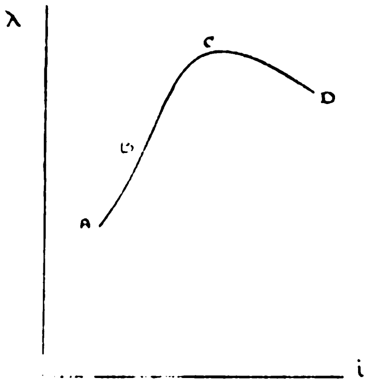

Fig. 32.

"We fix the retroaction or back coupling at an arbitrary value, vary the filament current, observe the wavelength and draw a curve connecting filamant current and wavelength. If at the highest permissible temperature of the filament the curve does not become flat, we reduce the back coupling and repeat the observations as may be necessary. If, on the other hand, the flat part is reached at a low filament temperature, we may increase the coupling if we desire to obtain a larger amplitude than that now obtained. Having completed the independent manipulation of the back coupling and the filamant current, we now link together permanently by aid of any suitable mechanism the adjusting device that varies the filament current, and the adjusting device that varies the retroactive coupling, so that if slight movements are afterwards made at will in either adjustment the other moves appropriately so as to keep the wavelength constant or nearly constant."

It is obvious that the filamant current should be adjusted to the right or left of C, according as to whether a decrease or an increase of its value is expected.

No. **162,338.** By H. St. J. de Aula Donisthorpe.

The invention relates to a special construction of the electrodes of a valve, and is illustrated in Fig. 33. Claims 1 and 2 read as follows:—

(1) "A thermionic valve of the three-electrode type, for use in wireless telegraphy, comprising a hollow hemispherical electrode, a hollow hemispherical grid within said electrode and a filament adjacent to or within the space enclosed by said grid."

(2) "A thermionic valve of the three-electrode type, for use in wireless telegraphy, comprising a hollow hemispherical electrode, a hollow hemispherical grid within said electrode and a loop filament adjacent to or within the space enclosed by said grid."

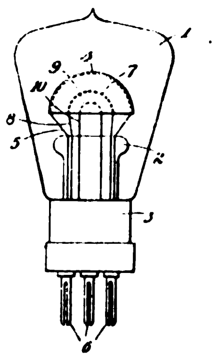

Fig. 33.

No. **163,487.** By The British Thomson-Houston Co., Ltd. (a communication from G.E.C. of America).

Consider the arrangement shown in Fig. 34. Since both the electrodes in the highly evacuated tube 1 are in the form of filaments 2 and 3, heated by batteries 4 and 5, the high frequency E.M.F., due to the signals received on aerial 8 and impressed between them through the resonant circuit 9–10

will result in the H.F. currents being substantially of the same shape as the signals. There will be no rectification, as the characteristic of the tube 1 is a straight line. Indeed, if K (see Fig. 35) represents the functional dependence of the current flowing from 2 to 3 on the P.D. between the latter, L will be the corresponding characteristic when the current from 3 to 2 is considered.

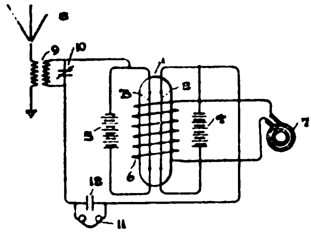

Fig. 34.

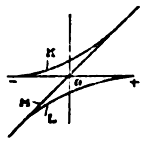

Fig. 35.

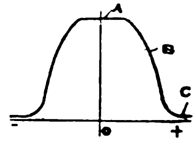

Fig. 36.

The resulting characteristic will, therefore, be represented by the straight line M. Let us now assume that a source 7 of A.C. is connected to the terminals of coil 6 wound round tube 1 in such a way that the axis of the alternating magnetic field is parallel to 2 and 3. It will then be found that the conductivity of the tube will depend on the momentary values of the A.C. flowing through 6 in the manner shown by the graph ABC (see Fig. 36). At the moment when the current in 6 is at its maximum value, say, in the positive direction, the conductivity reaches a minimum. As the current and the strength of the magnetic field decrease, the conductivity increases, until it reaches a maximum value shortly before the current passes through zero. It then remains at this value for some time while the current is growing in the negative direction. From a certain value of the current the conductivity begins to decrease until it becomes again minimum, either shortly before or at the moment when the current is maximum in the negative direction. The variation in the resistance of the valve is due to the fact that the magnetic field affects the path of the electrons. The latter move, usually, in straight lines. When a magnetic field is applied, the motion takes place along spirals and as the strength of the field is increased more and more of the electrons emitted by one electrode are prevented from reaching the other. At a certain value of the magnetic field practically no electrons can pass between the electrodes.

Suppose now, we make the frequency of source 7 equal to one-half of the signal frequency. Let curve i (Fig. 37) represent the current from

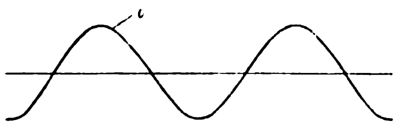

Fig. 37.

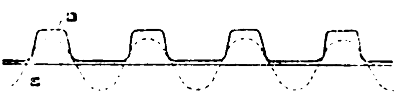

Fig. 38.

Fig. 39.

source 7 and curve E (*see* Fig. 38) the signalling potential impressed between 2 and 3. Curve D will then represent the variation in the conductivity of the tube. The resulting current through the latter will be given by graph F (Fig. 39). It will be seen that almost ideal rectification is obtained. After smoothing out, the rectified current can be used for actuating a recording device, but it cannot obviously be employed in connection with a telephone for the purpose of obtaining an audible note. Another drawback of the method just described consists in the necessity of keeping the frequency of the local source strictly equal to one-half of that of the signal. This condition is very hard to satisfy in practice. It is still harder to maintain the phase relation between the local and incoming currents. In view of this, it is proposed to adjust the frequency of the local source to a value slightly different from half of the signal frequency. In this case an audible note will be obtained of a frequency equal to

$$\pm 2\left(\frac{N - N_1}{2}\right)$$

where N and N_1 are the frequencies of the signal and local source respectively. The manner in which this is obtained is clearly seen from Fig. 40, where the

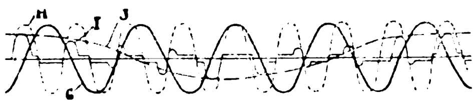

Fig. 40.

curves G, H, I, J represent respectively the locally produced current, the signalling potential, the current through the tube and the smoothed-out current flowing through the telephone.

A special advantage of the described detector consists in the rectilinear form of its characteristic (*see* line M on Fig. 35). It is well known that in the case of ordinary valve characteristics the current is proportional, not to the E.M.F., but to some power, higher than unity, of the latter. Roughly :

$$i = ke^2.$$

It follows that if an atmospheric is twice as strong as the signal, the output current, due to the atmospheric, will be four times as strong as that due to the signal. With the present arrangement, the ratio of currents will be only 2 : 1. It follows that the strength of atmospherics will be comparatively reduced.

No. **165,824.** By H. J. Round.

The invention relates to the construction of high-power transmitting valves, and is illustrated in Fig. 41, described by the inventor as follows :—

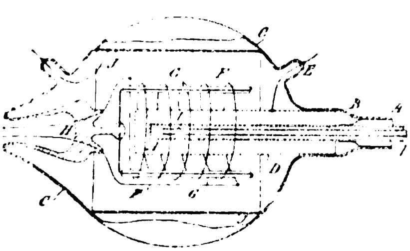

Fig. 41.

" A is a hollow metal tube, closed at its inner end and sealed at B into the glass of the bulb C and acting as the anode. It is surrounded by a grid D, the lead from which passes out through the glass at E. F is a filament, which is arranged preferably as a coil around the grid, and is maintained in position by supports G, the leads from it being sealed through the glass at H. I is a tube which is arranged along the axis of the anode A and through which cooling fluid may be introduced. J is a cage, or sheath,

of metal surrounding the filament for the purpose of preventing the emission from reaching the glass. In some cases this sheath may be provided with a negative charge of electricity."

No. **166,260.** By J. Scott-Taggart.

The invention relates to an electron discharge device, specially designed for the purpose of obtaining a negative resistance effect. The device and the circuits are illustrated in Fig. 42. A and B are two anodes, arranged on opposite sides of the filament F. G is the grid. The batteries C and D are connected with their positive poles to the anodes A and B respectively. The battery E is connected between A and G in such a manner that G is negative with respect to F. (If E were absent, the P.D. between F and G would be determined by the voltage of battery C.) It is obvious that the number of electrons reaching A and B together (apart from the small number of electrons absorbed by G) will be substantially equal to the total emission from the filament.

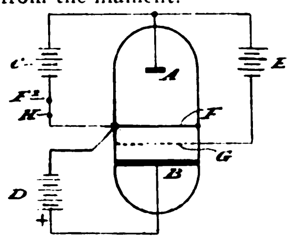

Fig. 42.

As to the distribution between A and B, the determining factor will be the potential of the grid. If G, for instance, is highly negative, no electrons at all will reach B, and the whole emission from the filament will be diverted towards A. With the increase of the grid potential, a portion of the electrons will be attracted by B, thereby causing a reduction in the A anode current.

Assume, now, that an E.M.F. is applied between points F¹ and H, for instance, in such a manner that the P.D. between A and F is increased. This would lead to an increase of the A current. However, as the P.D. between F and G is increased at the same time, a portion of the electrons is diverted from A to B. The current is therefore decreased. If the decrease is made to predominate (and this can obviously be obtained) the final result will be a decrease in the current of A following upon an increase of the E.M.F. and *vice versa*. In other words, the device behaves as a negative resistance and can be employed as such for various purposes, as for instance, amplification, generation of oscillations, etc.

The inventor refers throughout the specification to the device as "the Negatron."

161,667	12/1/20	1,007/20	H. R. C. Van de Velde and J. M. Furnival	Direction finding means for aircraft
162,067	21/1/20	1,871/20	W. H. Eccles and J. H. Vincent	Valve transmitters
162,097	28/1/20	2,687/20	E. Hoghton and Portholme Aircraft Co., Ltd.	Reception of C.W.
162,338	23/12/19	32,244/19	H. St. J. de A. Donisthorpe	Thermionic valve with hemispherical electrodes
162,367	23/1/20	2,338/20	A. K. Macronie, C. L. Fortescue, G. B. Bryan and H. Morris-Airey	Thermionic valve in metallic vessels
162,710	3/12/19	30,161/19	J. Scott-Taggart.. ..	Thermionic valve for use as amplifier, relay, detector, etc.
162,761	31/1/20	3,068/20	W. T. Ditcham	Thermionic valve transmitter
162,762	31/1/20	3,069/20	W. T. Ditcham	Thermionic valve transmitter
162,770	2/2/20	3,218/20	A. K. Macrorie and W. A. Appleton	Reception of C.W.
162,771	2/2/20	3,222/20	A. K. Macrorie and S. H. Long	Low frequency amplification in W.T. receivers
162,772	2/2/20	3,223/20	A. K. Macrorie and H. Morris-Airey	Holders for thermionic valves
162,773	2/2/20	3,224/20	A. K. Macrorie and H. Morris-Airey	Valves with two anodes
162,781	3/2/20	3,558/20	A. K. Macrorie and G. A. Irving	Transmitters for wireless telephony
163,070	24/12/19	32,413/19	S. B. Smith and G. M. Wright	Aerial system for direction finding
163,097	9/2/20	3,918/20	R. C. Clinker and B.T.H. Co., Ltd.	Frequency meters
163,117	11/2/20	4,273/20	A. K. Macrorie, H. Morris-Airey and G. Shearing	Reaction principle with valves
163,118	11/2/20	4,274/20	A. K. Macrorie and G. Shearing	Valve transmitters
163,448	14/2/20	4,583/20	H. M. Dowsett	Crystal detectors
163,458	16/2/20	4,739/20	A. K. Macrorie and G. Shearing	Valve transmitters
163,462	17/2/20	4,799/20	W. H. Eccles and J. H. Vincent	Receiving system
163,487	20/2/20	5,172/20	B.T.H. Co., Ltd., and G.E.C. of America	Valves magnetically controlled: detectors
163,725	7/3/17	3,023/17	H. L. E. Skipwith and C. L. Fortescue	Valve transmitters
163,745	12/1/20	974/20	B.T.H. Co., Ltd., and G.E.C. of America	Amplifiers: valve with two electrodes
163,810	26/2/20	5,813/20	E. Hoghton and Portholme Aircraft Co., Ltd.	Cascade arrangement of valves for amplification
163,855	19/3/20	8,177/20	J. Erskine-Murray and J. Robinson	Direction finding systems
164,100	27/2/20	5,987/20	S. Moehl	Masts
164,105	28/2/20	6,079/20	W. T. Ditcham	W. telephone transmitters
164,175	19/3/20	8,249/20	G. E. C., Ltd., B. S. Gossling and A. C. Bartlett	Cathodes for valves
164,242	15/6/20	16,154/20	Western Elec. Co., Ltd...	High frequency carrier current system
164,506	11/3/20	7,376/20	H. J. Round	Aerial system
164,527	16/3/20	7,818/20	A. W. Whistlecroft and H. R. C. Van de Velde	Aerial winch for aircraft stations
164,900	1/4/20	9,133/20	G. A. Mathieu	Valve relays or amplifiers
164,924	22/4/20	11,241/20	Igranic Elec. Co., Ltd., and Cutler-Hammer Manufacturing Co.	Controlling speed of machines by means of valves
164,937	23/4/20	11,312/20	J. Robinson and H. L. Crowther	Direction finding system
165,115	18/8/19	20,252/19	J. Scott-Taggart.. ..	Valves as amplifiers containing two grids
165,157	16/3/20	7,785/20	Western Elec. Co., Ltd...	Support for electrodes in vacuum tubes
165,217	24/3/20	8,683/20	W. A. E. Quilter ..	Grids for valves
165,279	28/4/20	11,748/20	J. Scott-Taggart, F. O. Read and P. W. Engelbach	Support for electrodes in vacuum tubes
165,281	29/4/20	11,895/20	H. W. Sullivan and J. Joseph	Variable condensers

BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1921 *(continued)*.

Specification No.	Date of Application.	No. of Application.	Name of Inventor.	Subject.
165,576	15/4/20	10,552/20	A. R. Taylor	Inductance coils
165,824	5/5/19	11,202/19	H. J. Round	Means for cooling electrodes of valves
165,888	29/1/20	2,808/20	S. Brydon..	Valves for recording purposes
165,889	2/2/20	3,220/20	A. K. Macrorie and G. Shearing	Safety device for valves
165,959	8/4/20	9,897/20	A. McLellan and H. J. Round	Safety device for valves
165,985	22/4/20	11,239/20	Igranic Elec. Co., Ltd., and Cutler-Hammer Manufacturing Co.	Method for converting D.C. into A.C. by means of valves
165,986	22/4/20	11,240/20	Igranic Elec. Co., Ltd., and Cutler-Hammer Manufacturing Co.	Frequency changer
165,994	27/4/20	11,667/20	H. L. Crowther, L. A. McDougald, H. Morris-Airey and G. A. Irving	Transmitters for W. telephony
166,156	30/1/17	1,515/17	N. Oboukhoff	Frequency changers
166,189	12/6/18	9,642/18	J. Scott-Taggart.. ..	Instrument for measurement of capacity of condensers
166,195	26/9/18	15,695/18	J. H. Hammond.. ..	Secret system of wireless telegraphy and telephony.
166,223	20/5/19	12,610/19	J. J. Aurynger	Detectors
166,224	22/5/19	12,939/19	H. Antranikian	H.F. alternator
166,237	28/7/19	18,051/19	J. Scott-Taggart ..	Detectors
166,241	7/8/19	19,498/19	H. J. Round	Valve with low internal resistance
166,259	16/9/19	22,790/19	C. Lorenz, A-G.	H.F. alternator
166,260	17/9/19	22,863/19	J. Scott-Taggart.. ..	"Negatron." Valve with two anodes
166,300	11/2/20	4,275/20	A. K. Macrorie and G. Shearing	Method for eliminating effects of parallel resonance in connection with valve transmitters
166,358	15/4/20 15/7/20	10,551/20 21,354/20	A. R. Taylor	Wireless Telephone transmitters: special anode control
166,365	20/4/20	10,944/20	B.T.H. Co., Ltd., and G.E.C. of America	Thermionic valve
166,578	10/1/19	778/19	H. R. Rivers-Moore ..	Localisation of a submerged cable
166,594	27/9/19	23,801/19	S. Brydon	W. telephone transmitters
166,634	16/3/20	7,851/20	A. K. Macrorie, H. Morris-Airey, G. Shearing and R. L. Randall	C.W. transmitters
166,640	25/3/20	8,833/20	A. K. Macrorie and G. Shearing	Cathodes for valve with uniform current distribution
166,662	14/4/20	10,404/20	Western Elec. Co., Ltd. ..	H.F. carrier current system
166,680	17/4/20	10,760/20	K. E. L. Guinness ..	Method for eliminating magneto noises on aircraft
166,760	11/5/20	13,042/20	B.T.H. Co., Ltd. and G.E.C. of America	Magnetically controlled valves for generation of H.F. currents
166,780	21/5/20	14,043/20	J. Robinson and R. T. Smith	Direction finding system
166,913	3/5/20	94/20	G. A. Mathieu	Intervalve transformers
166,940	17/4/20	10,709/20	W. H. Eccles	Relays
166,958	23/4/20	11,311/20	C. K. Chandler ..	Direction finding apparatus
167,018	12/5/20	13,160/20	G. M. Wright	Radiogoniometer
167,266	3/5/20	12,231/20	Edison Swan Elec. Co., Ltd., and J. Scott-Taggart	Arrangement of electrodes in valves
167,561	7/5/20	12,718/20	B.T.H. Co., Ltd., and G.E.C. of America	Thermionic valves magnetically controlled
167,567	8/5/20	12,808/20	B.T.H. Co., Ltd., and G.E.C. of America	Thermionic valve transmitters
167,584	11/5/20	13,086/20	A. K. Macrorie and G. Shearing	Aerial insulation
168,072	25/5/20	18,257/19	J. B. Bolitho	Selective receiving system
168,107	22/4/20	11,242/20	Igranic Elec. Co., Ltd., and Cutler Hammer Manufacturing Co.	Valve relays
168,249	1/9/20	25,172/20	W. W. Burnham ..	Inductances
168,394	29/5/20	14,680/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Relays in combination with valves
168,407	31/5/20	14,807/20	A. K. Macrorie, H. Morris-Airey and G. Shearing	Support for filaments in valves

NOTE.—The above list of British patents includes those published between October 22nd, 1920, and September 29th, 1921.

NAME INDEX TO BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1921

NAME INDEX TO BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1921 (*continued*).

U.S.A. PATENT SPECIFICATIONS PUBLISHED DURING 1921

Specification No.	Date of Application.	Patentee.	Assignee.	Subject.
1,357,657	21/9/18	E. O. Scriven ..	Western Elec. Co...	Generators of low frequency
1,357,710	29/11/18	W. K. Kearsley	General Elec. Co...	Apparatus for removing gases from vacuum tubes
1,358,143	30/8/18	L. F. Fuller ..	Federal Telegraph Co.	Signalling with C.W. transmitters
1,358,144	14/4/19	L. F. Fuller ..	A. Taylor	Method of signalling with arc generators in parallel
1,359,310	24/6/18	J. J. Amyynger	—	Detector condenser
1,359,979	3/1/20	C. S. Franklin ..	Radio Corporation of of America	Aerial system
1,360,126	26/5/17	D. G. McCaa ..	—	Signalling with C.W. transmitters
1,360,167	13/9/17	E. F. W. Alexanderson	G.E.C. of America ..	Aerial system
1,360,168	15/2/18	E. F. W. Alexanderson	G.E.C. of America ..	Aerial system
1,360,169	24/12/18	E. F. W. Alexanderson	G.E.C. of America ..	Aerial system
1,360,740	8/9/17	R. V. L. Hartley	Western Elec. Co...	Means for reducing speech distortion
1,361,099	21/5/20	H. J. Round ..	Radio Corporation of America	Means for cooling anode of valve
1,361,487	6/1/20	H. S. Osborne ..	American Telegraph & Telephone Co.	Means for selecting desired frequencies in radio-signalling
1,361,813	19/7/17	W. E. Booth ..	Western Elec. Co...	Cabinet for transmitting and receiving set
1,362,059	28/9/17	P. Thomas ..	Westinghouse Elec. and Mnfg. Co.	Condenser
1,362,383	19/4/19	W. E. Beakes ..	United Fruit Co. ..	Aerials in the shape of coils buried under the ground
1,362,612	15/5/16	L. Espenschied	American Telephone and Telegraph Co.	Method of eliminating interference
1,363,032	19/12/19	E. Bancroft ..	—	Wireless synchroniser
1,363,319	14/7/16 15/2/18	J. L. Hogan, jr.	S. M. Kintner and H. M. Barrett	Reception by the method of interference
1,364,495	26/8/20	H. J. Round and W. T. Ditcham	Radio Corporation of America	Signalling with C.W. transmitters
1,365,157	3/2/16	L. de Forest ..	De Forest Radio Telephone and Telegraph Co.	Cathodes for valves
1,365,292	18/4/19	P. Thomas ..	Westinghouse Elec. and Mnfg. Co.	Condensers
1,365,576	11/10/17	W. C. White ..	General Elec. Co. ..	Valves as detectors
1,365,579	14/6/19	T. Appleby and L. M. Knoll	C. D. Ehret ..	Aerials buried under the ground or submerged
1,365,734	18/3/19	S. P. Shackleton	American Telephone and Telegraph Co.	Electron-tube-testing apparatus
1,365,787	2/8/15	F. K. Kroger ..	International Radio Telegraph Co.	Quenched spark transmitters
1,365,926	21/10/19	T. M. Libby ..	H. G. Cordes ..	Method of eliminating interference
1,365,977	18/6/17	L. F. Fuller ..	United States of America	Signalling with arc transmitters
1,366,160	8/5/16	A. J. Kloneck	—	Rotary spark-gap
1,366,311	26/6/18	F. Cutting and B. Washington	—	Interrupter shunted across spark-gap for producing oscillations
1,366,411	19/2/16	A. McLean Nicolson	Western Elec. Co...	Valves with two filaments and two plates
,366,830	19/12/17	F. E. Pernot ..	G. L. Greves ..	Frequency-selector receiving-circuit
,366,953	13/10/19	H. K. Sandell ..	H. S. Mills . ..	Valves as detectors and amplifiers
367,165	21/7/19	H. Pratt ..	—	Recorder
367,224	5/1/16	L. de F. Arnold	Western Elec. Co...	Method of eliminating atmospherics

U.S.A. PATENT SPECIFICATIONS PUBLISHED DURING 1921 *(continued).*

Specification No.	Date of Application.	Patentee.	Assignee.	Subject.
1,369,281	4/11/18 19/1/21	O. C. Roos ..	—	Signalling with arc transmitters
1,369,781	20/2/18	T. W. Case ..	—	Light-rays signalling system
1,370,093	10/3/19	G. B. Crouse and I. H. Mills	Sperry Gyroscope Co.	Receiver panels
1,370,504	30/11/12 23/7/20	J. H. Hammond, jr.	—	Tele-stereotypy
1,370,688	22/1/14 22/5/20	J. H. Hammond, jr.	—	Control of moving bodies by wireless
1,370,735	30/9/20	C. S. Franklin..	Radio Corporation of America	Aerial system
1,371,061	29/3/19	C. D. Tuska ..	—	Condenser
1,371,228	8/10/17	A. M. Curtis ..	Western Elec. Co...	Wave filters for reducing atmospherics
1,371,567	26/12/16 22/9/20	R. H. Marriott	—	Method of eliminating atmospherics
1,371,757	7/10/20	E. W. B. Gill..	Radio Corporation of America	Valve as current limiting device
1,372,202	7/10/16	I. Shoenberg..	Radio Corporation of America	Frequency multiplier
1,372,203	7/10/16 12/2/19	I. Shoenberg..	Radio Corporation of America	Frequency multiplier
1,372,425	15/6/12 5/2/19	J. H. Hammond jr.	—	Simultaneous transmission and reception of a plurality of messages
1,372,426	29/5/12 15/3/19	J. H. Hammond jr.	—	Multiple telephony with arc generators
1,372,658	11/4/19	E. T. Jones ..	—	Aerials buried under the ground or submerged
1,372,808	1/4/18	A. L. Golden ..	—	Discharger immersed in liquids
1,373,504	11/9/18	H. W. Hitchcock	American Telephone and Telegraph Co.	Variable condenser
1,373,612	19/3/19	E. C. Hanson..	—	Aerials contained in conduits buried under the ground
1,373,710	24/10/19	V. J. F. Bouchardon	—	Method of switching over from spark to valve transmitting set
1,373,931	5/6/19	E. F. W. Alexanderson	General Elec. Co...	Reception of C.W.
1,374,170	27/3/16	A. J. Kloneck	—	Generating system for H.F. currents
1,374,293	28/7/19	R. A. Fessenden	—	Direction finder
1,374,679	15/3/20	J. B. Pratt ..	General Elec. Co...	Means for removing gases in vacuum tubes
1,374,832	27/9/19	H. P. Donle ..	Connecticut Telephone and Elec. Co.	Vacuum-tube base
1,375,481	4/11/16	H. de F. Arnold	Western Elec. Co...	Power modulators with valves
1,375,982	16/11/16	E. Thomson ..	General Elec. Co...	Condenser
1,375,992	18/4/19	E. F. W. Alexanderson	General Elec. Co...	Directional receiving system
1,376,051	10/4/19	A. H. Taylor..	—	Simultaneous transmission or reception of speech or signals
1,376,192	8/11/18	G. J. Dye ..	—	Radio aerial torpedo
1,376,679	10/10/17	A. M. Curtis ..	Western Elec. Co...	Means for reducing atmospheric disturbances in receivers
1,377,059	26/6/18	B. Washington and F. Cutting	—	Quenched spark-gap system
1,377,129	2/1/15	W. Hahnemann	Signal Gesellschaft	W.T. beneath water by means of very high frequences
1,378,345	31/5/19	R. F. Hall ..	Research Corporation	Relays
1,378,982	17/9/18	H. E. Shreeve..	Western Elec. Co...	Linking land lines to radio station
1,379,144	8/2/18	P. Ware ..	Ware Radio Inc...	Duplex
1,379,166	22/1/18	T. W. Case ..	—	Radiant-energy signalling system
1,379,167	20/2/18	T. W. Case ..	—	Detectors in the form of a gas-filled bulb with three electrodes
1,379,184	1/11/17	L. A. Hazeltine	Ware Radio Inc...	Shielding radio apparatus
1,379,262	16/9/19	S. C. Hooper and G. H. Clark	—	Aerial system
1,379,541	29/10/19	J. Erskine-Murray and J. Robinson	—	Direction finders

.A. PATENT SPECIFICATIONS PUBLISHED DURING 1921 *(continued)*.

Specification No.	Date of Application.	Patentee.	Assignee	Subject.
1,379,589	5/6/18	H. H. Hyder ..	—	Exploding mines by wireless control
1,379,706	10/3/17	R. A. Weagant	Radio Corporation of America	Valve with electrode placed outside evacuated vessel
1,380 206	10/3/17	R. A. Weagant	Radio Corporation of America	Valve with electrode placed outside evacuated vessel
1,380,663	16/5/18	J. Lindgren ..	-	Wireless distant-control device
1,380,872	24/9/17	R. E. Thompson	-	Quenched spark-gap transmitter
1,381,089	20/4/20	H. H. Beverage	General Elec. Co...	Directional aerial system
1,381,626	19/1/18	L. F. Fuller ..	Federal Telegr. Co.	Frequency changer
1,381,692	12/4/19	C. Bardeloni ..	--	Crystal detectors combined with valves for reception
1,382,177	10/7/16	W. Dubilier and P. Dubilier	Sperry Gyroscope Co.	Quenched spark-gap transmitter
1,382,590	3/1/20	W. G. Zeigler..	—	Submarine wireless system
1,382,786	3/6/16	A. J. Kloneck..	—	Rotary spark-gap
1,384,108	9/4/14	R. A. Weagant	Radio Corporation of America	Valves as generators
1,384,523	1/11/19	A. A. Hall ..	—	W.T. without aerials
1,385,090	19/2/16	J. Mills ..	Western Elec. Co. ..	Method of eliminating disturbances
1,385,091	25/9/16	J. Mills ..	Western Elec. Co...	Method of eliminating disturbances
1,385,121	23/3/20	H. F. Elliott ..	A. Taylor	Means for keeping arc steady
1,385,379	26/1/17	F. Kratz ..	American Bosch Magneto Corpor.	Condensers
1,385,818	14/6/19	C. L. Farrand..	Radio Corporation of America	Valve with two grids and tow plates
1,385,873	5/6/16	A. W. Hull ..	General Elec. Co...	Dynatron: valve with negative resistance
1,386,830	5/8/15	E. F. W. Alexanderson	General Elec. Co...	Radio frequency generator
1,386,840	29/11/19	R. C. Clinker..	General Elec. Co...	Portable receivers
1,387,262	30/9/15	R. V. L. Hartley	Western Elec. Co...	Reception by the method of interference
1,387,736	8/3/20	J. H. Rogers..	—	Submarine signalling
1,387,850	7/6/12 18/1/21	J. H. Hammond. jr.	—	Control of moving bodies by wireless
1,387,885	9/3/18	W. R. Davis	W. H. Dunwoody, Industrial Institute	Method of teaching Morse in class-rooms
1,387,984	30/8/15	A. W. Hull ..	General Elec. Co...	"Dynatron"
1,387,985	13/11/16	A. W. Hull ..	General Elec. Co...	"Dynatron"
1,387,986	10/3/17	A. W. Hull ..	General Elec. Co...	"Dynatron"
1,388,336	25/2/19	E. C. Hanson..	—	Aerials buried under the ground or submerged
1,388,441	1/10/15 14/1/21	M. I. Pupin and E. H. Armstrong	—	Method of screening antennae from atmospherics
1,388,450	3/9/15 13/1/21	E. H. Colpitts and H. de F. Arnold	Western Elec. Co...	Modulators with valves
1,388,793	5/1/17	W. T. Birdsall..	Westinghouse Lamp Co.	Vacuum-tubes as rectifiers
1,388,834	19/1/18	F. Lowenstein..	—	Quenched spark-gap transmitters

THE PROGRESS OF WIRELESS TELEPHONY IN AIRCRAFT.

BY H. C. VAN DE VELDE.

IN the "Year Book" of 1920, Major Prince, towards the end of his article, "Wireless Telephony and its Application to Aircraft," indicated the lines on which wireless apparatus in aircraft would possibly develop. It is the purpose of this article to describe the progress which has taken place since that date; to give some idea of the problems which confront wireless engineers who are about to provide wireless telephone facilities for the modern aeroplane; and finally, to give a general idea of the trend of modern research work in relation to wireless telephony in aircraft for the future.

Late in 1919, intensive work was being carried out with a view to providing a "fool-proof" wireless telephone for aircraft, and at the end of that year two machines, namely, the Airco "G-EALU" and the Handley-Page "G-EALX," were equipped with what was then the most modern apparatus. This apparatus, although sound in principle, was far from being a commercial proposition, since a number of problems which were inherent from a wireless point of view to aircraft, had still to be tackled. These machines were fitted with a transmitter, which gave very good results indeed, and except for questions of detail the circuits employed in that set are still used in up-to-date apparatus. Totally different results, however, were obtained with the receiver. This employed three valves—a detector, and two note magnifiers—and had a plain aerial circuit with a small range of variation of wavelength by means of a variometer. Reaction was provided in the normal manner, by coupling the anode circuit of the detector valve back into the aerial circuit, and no provision was made for remote control. The design of the set also rendered it peculiarly susceptible to interference from the ignition system of the aeroplane.

At that time, very little was understood regarding this problem, and although many efforts at a solution had been made, all had proved abortive In consequence, considerable interference was caused with incoming speech, and in order to obtain fair ranges, a set had to be worked so near to reaction point that the consequent distortion produced rendered it very difficult to understand what was being said. In fact, to any but a very practiced operator, the distortion precluded any possibility of the speech being understood.

The natural limitations of the receiver rendered it, therefore, impossible to obtain any but quite short ranges, something in the neighbourhood of between 20 and 30 miles as a maximum.

Early in 1920, however, a five-valve receiver was designed, and with its birth the results obtained exceeded all expectations. From the moment the first sample was tested on the Marconi aeroplane "G-EAAB" at Croydon Aerodrome, it was realised that good reception of telephony in the air was a *fait accompli*. In machines where it had been impossible to work at all before, owing to distortion and the interference from the magnetos, it was now possible to instal a set and obtain first-class results. Where formerly it had been difficult to obtain understandable speech at short ranges, it became a common occurrence to obtain good readable signals up to ranges of 150 to 200 miles with perfect ease.

Every step was taken to instal this receiver on the machines flying on the London-Paris Airway, and the results obtained were so excellent that the Aircraft Transport Companies then functioning on this route had the whole of their machines equipped and successfully working by the end of 1920.

Reference to "Aircraft Fitted with Wireless Telephony," in the 1921 "Year Book" will show that no less than fourteen machines were then fitted, a fact which in itself speaks volumes, when it is considered under what difficulties Aircraft Companies were labouring.

In order to incorporate a number of improvements which had been effected during the experience gained on aircraft during 1920, the Marconi Company at the latter end of the year produced the A.D.2. This set differed in few respects from the A.D.1 and A.D.3, employed up to that time, except that in the case of the A.D.2, the transmitter and receiver were fitted together in one box and the principle of the generator supplying all the current for the set was incorporated.

A small battery was still employed, but its only purpose was to provide the means of regulating the generator, the perfectly regulated generator having not yet been designed. This generator supplied all the necessary high tension current for the transmitting valves and the low tension current for the filaments of the transmitting and receiving valves.

During 1921, every British machine regularly flying on the London-Paris air route was equipped with the A.D.2, and the results obtained have been truly remarkable.

On several occasions machines have been directed to the London Aerodrome by means of the direction-finding facilities provided at the aerodrome station at Croydon, through thick fog and exceedingly bad weather. This fact alone illustrates the value of wireless communication with aircraft, as on each occasion these machines were filled with passengers, and in all probability, had no wireless facilities existed, bad "crashes," with possible loss of life, might have been occasioned.

The ranges daily obtained from the aircraft to the ground have always been of the order of something over a hundred miles, and in numerous instances the machines have been heard speaking immediately they ascended from the Paris Aerodrome, a distance of approximately 240 miles.

A special maintenance organisation has been set up under the direction of Captain Furnival at Croydon Aerodrome, and it is due largely to his highly specialised staff that the failures occurring have been something in the order of less than 5 per cent of the total number of flights made. When it is considered under what extraordinarily bad conditions the wireless telephone works in aircraft, and also the fact that the whole of the installations are handled by non-technical personnel, *i.e.*, the pilots and engine mechanics, it speaks volumes for the efficiency of the sets and the maintenance system. that the failures figure is so small.

The following is a list of machines which have been fitted in all parts of the world since the Armistice with Marconi Wireless Telephones. A total of between 50 and 60 have been equipped of the following types :—

D.H.6.
D.H.9.
D.H.16.
D.H.18.
D.H.29.
Handley Page 0/400.
Handley Page Super.
Handley Page W.8.
Handley Page Flying Boat.
Avro 2-seater.
Avro Seaplane.
Parnall Panther.
Bristol 10-seater.
Bristol Fighter.
F.5 Flying Boat.
Westland 6-seater.
Westland 4-seater.
Vickers-Vimy.
Farman-Goliath.
Ansaldo.
Brandenburg Seaplane.

It will be immediately realised that with such an assorted and varied number of types of machines, the installing of wireless telephones cannot under any sense be standardised, but on the contrary, each and every machine has to be treated as a special case. It is therefore proposed to outline a few of the problems which are involved when about to provide a wireless telephone in an aeroplane.

PROBLEMS INVOLVED WHEN INSTALLING A WIRELESS TELEPHONE IN AIRCRAFT.

When a ground or ship station is to be erected, certain fixed constants, such as length and height of aerial, power supply, characteristics of the surroundings, and above all, the space for the installation of the apparatus, can be ascertained and worked to. When equipping an aeroplane, no such constants can be given, and it is not until after inspection of the craft is made that the engineer can even approximately guess the problems which have to be overcome.

Firstly, there is generally the ever present magneto disturbance which has to be overcome before the installation can hope to be successful. For the benefit of those readers who know little or nothing about aircraft wireless, a few words on "Mag noise," as it is commonly called, will not be amiss.

In a modern high-power aeroplane, such as a Handley Page or Vickers-Vimy, there are two engines, each with twelve cylinders and four magnetos. Each of these magnetos is arranged to cause sparks in six cylinders, and for safety's sake the ignition system is duplicated, so that if one magneto fails the other carries on and no engine failure results.

There are, therefore, two lengths of wire from the magnetos to the two sparking plugs in each cylinder. At the proper moment when the primary coil of the magneto is broken at the "Make and Break," the potential builds up at the points of the plug to some thousands of volts, until it is high enough to overcome the resistance of the gap. A spark then passes and an oscillatory discharge takes place. It will thus be seen that in the ignition system of each cylinder of an aeroplane engine there is, in effect, a Hertzian oscillator. A condenser, formed by the capacity of the wires to the engine frame; inductance—of the leads themselves—and a spark gap, *i.e.*, a complete wireless transmitter in miniature.

The waves radiated are of high frequency and extremely short wavelength. It will thus be appreciated that each engine has twenty-four of these miniature transmitters all radiating these waves. If, therefore, a sensitive receiver is to be installed, there is first and foremost the problem of reducing to silence these 48 miniature transmitters. Owing to the nature of the waves radiated, it is impossible to tune these out any more than it would be possible to tune out a feeble plain aerial spark transmitter working at close quarters, or atmospherics to which they closely approximate.

As a result, a limitation is imposed on the sensitiveness and magnifying power of the receiving apparatus, and consequently, on the range which can be obtained from the aeroplane to any wireless station with which it is desired to communicate. The only satisfactory way of eliminating this trouble is by screening, *i.e.*, enclosing the ignition system in a complete metal screen. This can be carried out in two different ways:—

1. One method is to surround completely the engine with a metal cowling. This in many cases is partially done by the engine designers, but it is an extremely difficult job on some engines, where, for instance, the cylinders project through the top of the cowling provided. On twin-engined machines, such as the Handley Page or Vickers-Vimy, the engines are completely enclosed, or nearly so, but it is necessary in cases of this description to braid all the wires leading to the starting magnetos and switches.

   This system of overcoming magneto interference is usually sufficient where the degree of magnification being employed is not very high, but it is not always satisfactory, since the smallest space left unscreened enables the waves to escape and cause interference almost as badly as if no screening were employed.

2. The second method is to screen completely, or enclose in metal, the whole of the component parts of the magneto system. This is a much more simple method when it is carried out while the engine is being built, and before it is installed in the aeroplane, but a very different

matter when once the machine is completed without it, as those who have seen the amazing complication of an aero engine will realise.

A complete specification for carrying out this work has recently been issued by the Marconi Company, which ensures that no magneto noise will exist on machines where their system is employed. The principle employed in this specification is, firstly, to wire the engine with special copper braided ignition wire; secondly, to provide an effective screened aero plug, which has been designed in conjunction with the Robinhood Engineering Works, the well-known K.L.G. manufacturers, and thirdly, totally to enclose the magnetos with an iron cover on which a coating of copper has been deposited.

With this system it is possible to employ any degree of magnification, and also to work on extremely short waves, a thing which has been impossible in the past, owing to the wavelength of the radiations from the ignition system.

Having satisfied his mind on the foregoing problem, the engineer surveys the machine on which is to be installed the wireless telephone set.

For the aerial system, instead of the usual antenna supported on masts, which is common practice on ground and ship stations, the antenna on an aeroplane consists of a length of wire trailing from the machine in flight, the usual length employed being 100 to 250 feet, according to the character of the machine and requirements of the service. Provision has to be made for the aerial to be wound up when the machine is about to land or take off. For this purpose a winch has to be employed and a position must be selected so that the pilot can operate it without interfering with the flying controls of the machine. This occasionally is not an easy matter. Size is often the deciding factor in the installation of the winch. The very latest idea in aircraft winches recently patented by the Marconi Company is quite small, and, moreover, has no spinning handle while the aerial is running out. One handle is employed, which, by means of special mechanism, performs three functions, viz., when pulled backwards it allows the aerial to run out, while in the neutral position it acts as a brake or lock, and when rotated in the usual manner winds in the aerial. It is, therefore, easily operated with one hand and installed in the smallest possible space, making it an ideal winch for a machine on which the pilot has to operate the wireless while flying his machine.

The next piece of apparatus to be installed is the "Fairlead." This approximates to the "leading in" insulator on a ground station, and is usually placed on the deck of the machine, so that the aerial may run straight down from the winch and out into space. This is, however, not always possible.

As a practical instance, the Vickers-Vimy "Commercial" may be quoted. This machine is admirably designed for transport work by the makers, so that in the event of a forced landing in the sea it has all the qualities of a boat and will float indefinitely.

Beneath the pilot's seat, near to which the winch must necessarily be installed, are petrol tanks, the combination of these two factors making it imperative that the fairlead should be taken out high up through the side of the machine. Unfortunately, just where the aerial should be taken through, is the tip of the whirling propeller, and unless some means is employed to prevent it, any slackness in the wire will be sucked in by the vacuum created by the propeller. To overcome this difficulty, a system of insulators is fitted down the side of the fuselage, and on to the undercarriage from which the aerial drops into space.

The insulators have to be joined with thick rubber tubing, so that in the remote event of the weight becoming detached through some unforeseen circumstances, the wire will not be pulled into the vacuum created by the propeller.

After the aerial system has been satisfactorily installed, the sets themselves have to be mounted. As described in the previous issue, sets for use on machines which are operated by the pilot are designed so that the controls can be placed on the dashboard, while the box containing the main apparatus can be put anywhere convenient. Often, however, the problem of finding space is a matter of considerable difficulty, and perhaps the only possibility will present itself at the extreme rear of the machine. Special fittings have

to be made, and generally the whole question of installing the sets may tax the ingenuity of the engineer to the utmost.

After the sets are fitted, the connecting wires to the remote controls have to be run, and here again very often extreme difficulty is encountered in finding an easy run for these wires, since the main set may be on one side of a bulk-head and the controls some distance away on the other.

Finally the power source—the high tension generator and battery—must be installed. The high tension generator must be fitted wherever convenient, and in designing and carrying out this, the wireless engineer usually works in consultation with the aeroplane designer.

A propeller suitable for the cruising speed of the machine must be obtained, and the installation is then ready for initial ground testing and subsequent air test.

The air test requires in itself highly technical and specialised treatment, since, firstly, the conditions under which these tests have to be made are all against the engineer, who has to make highly accurate and delicate adjustments under the most adverse conditions; and secondly, the fact that air testing is necessarily a very expensive item, and, therefore, the results obtained on the one flight must guarantee that no further flights will be required subsequently.

THE TREND OF THE SCIENCE OF AIRCRAFT WIRELESS.

With the continued improvement of the aeroplane and the efforts of the aeroplane designers to produce a machine capable of flying in any weather at all times, it is only to be expected that those interested in the design of aircraft wireless apparatus are devoting the whole of their energies to producing sets which will assist this work.

There can be no doubt that wireless will play a most important part in guaranteeing the safety of the aeroplane of the future engaged on long distance flights, often through fog over sea, miles away from land, when it will be impossible to obtain bearings for navigation by direct observation.

On the successful functioning of the "Wireless" may hang the lives of passengers and crew, and it is, therefore, the policy to produce apparatus which will be absolutely reliable under all conditions, and be of the utmost assistance in the safe navigation of the machine.

One of the most interesting developments, therefore, is the Aircraft Direction Finder (Type 14), just produced by the Marconi Company.

As a general rule, direction finding for aircraft purposes is effected by means of fixed apparatus at ground stations, the bearings obtained being transmitted to the machine.

In certain cases, however, as for example in airships or passenger aeroplanes, where space permits, mobile and self-contained equipment carried in the machine and operated independently from the latter's ordinary wireless installation may be used to advantage, especially where aircraft is intended to travel along non-organised air routes, without the proximity of suitably equipped ground stations.

With this in view, the Type 14 Direction Finder has been specially designed for use in aircraft. It is the outcome of extended experience, both in the science of direction finding and its particular application to aerial navigation.

General Features of Design.—In the design of this instrument, considerable attention has been given to three points—space and weight, screening, and simplicity of operation.

The weight has been brought to the lowest possible limit by the extensive use of light-weight woods, metals and alloys, whilst to ensure its equal distribution on the machine, the unit principle has been adopted, the space occupied being at the same time reduced to a minimum. The approximate weight of the complete installation is 30 lbs. 2 ozs.

Simplicity of operation forms an outstanding feature, and has been developed to such an extent as to render unnecessary highly skilled personnel.

Wavelengths.—The receiver is designed for a waverange of 600 to 1,000 metres, thus covering all the wavelengths normally required in aircraft wireless practice.

The Aerial System.—The size and shape of the two loops forming the aerial are governed entirely by local conditions.

From a wireless standpoint they should embrace as large an area as possible and be fastened rigidly in position. In cases where one of the loops is smaller than the other, its natural wavelength being consequently lower, use is made of an adjustable calibrating choke to provide the necessary balance. This choke consists of an air core coil with suitable tappings.

BRIEF DESCRIPTION OF THE COMPONENTS.

The Direction Finder.—From Fig. 1 it will be seen that the "field" coils A and B of the Direction Finder Component are connected in series with the loop aerials, while the calibrating choke is inserted in the smaller loop.

Within the fixed field coils is situate a rotatable "search" coil, connected to the primary winding of a transformer. Thus the two field coils, mounted at right angles the one to the other, form two independent primaries of a loose coupled high frequency transformer, the search coil being the secondary.

To the spindle of the search coil is fixed a circular metal disc, on which there are two arrows, engraved at right angles to each other. The disc is capable of rotating inside a circular scale calibrated from 0 to 360 degrees.

One arrow indicates the plane of the received signals, once the correct adjustments have been made, while the other, marked "Sense," can be used to select the actual positive bearing of the station from the two possible directions.

The Tuning Unit.—The Tuning Unit consists of a high-frequency transformer having two secondary windings and one primary, the aerial tuning condenser, aerial tuning inductance, phasing resistance, and "D.F. Sense" switch.

The transformer is for the purpose of transferring the energy received by the search coil to the amplifier circuit, either of the two secondaries, and the tuning condenser forming a closed oscillatory circuit.

In order to understand the function of the aerial tuning inductance and phasing resistance, it should be remembered that, quite apart from its well-known directional properties, a double-loop aerial system also oscillates as a whole with regard to earth under the action of the received signals. In other words, this form of direction finder aerial behaves as if it were composed of a directional portion and a non-directional one, the latter acting like a plain vertical aerial.

This second effect, which is made practically to disappear when "direction" finding only is required, is, on the contrary, utilised in combination with the first, to determine the "sense," as explained in a later paragraph.

By means of the vertical aerial inductance and the phasing resistance, the signals received by virtue of the vertical action of the aerial, are tuned in and sufficiently reduced so as to be equivalent to the directional action of the aerial, thus making possible the required phasing.

The Amplifier used.—This unit comprises eight valves, six acting as amplifiers, the seventh as a rectifier, and the remaining one as a note magnifier, all being interconnected by transformers.

On the left-hand side of the instrument is a potentiometer, which effects simultaneously the potential on the grids of all the amplifying valves. A small rheostat is also provided for controlling the brilliancy of the valve filaments.

METHOD OF OPERATION.

"D.F." Position.—As will be seen in Fig. 1, the action of placing the switch on the tuning unit in the "D.F." position connects to earth the midpoints of the field coils A. and B. Thus, the only way in which the high-frequency transformer (and subsequently the amplifier) can be influenced, is through the search coil.

The "frame" or "directional" action of the aerials is thus brought into play in the usual way. Each loop receives signals of maximum or minimum strength, according to whether the transmitting station lies in its own plane or in a plane at right angles, intermediate results being obtained

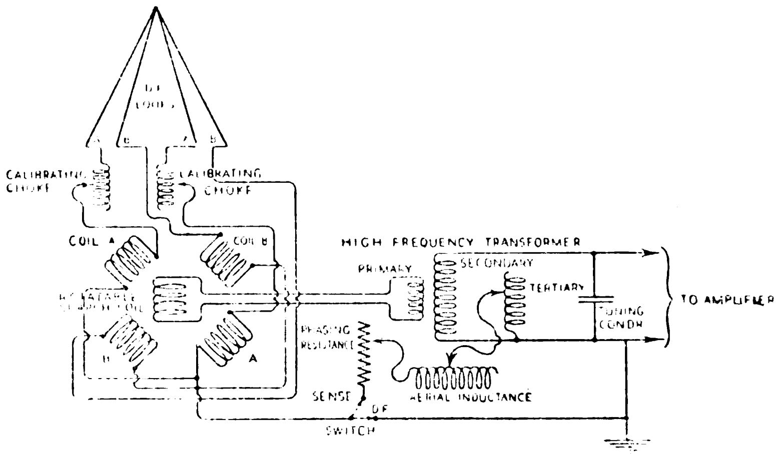

Fig. 1. Diagram of connections, Aircraft Direction Finder, Type 14.

in intermediate positions. The magnetic field set up by the fixed coils directly influenced by the loops, is of such a nature that maximum strength of signals is received by the search coil when it lies in the same plane as that of arrival of the received signals, minimum strength being obtained with the search coil in a position at right angles.

In practice, the minimum effect is used, and as the spindle of the search coil carries a disc rotatable inside the circular scale, readings can be taken by means of the unmarked arrow on the disc, once the handle has been swung round until signals are heard with minimum strength.

The polar curve showing the relationship between the strength of reception and the position of the search coil with regard to the direction of the transmitting station, is the well-known figure of eight shown in Fig. 2. From this diagram it will be seen that in the D.F. position two minima can be found, 180° apart on the scale, determining only the plane in which the signals sweep past the aerial.

It is therefore necessary to discriminate between the two, *i.e.*, to determine the "sense" of reception.

"*Sense*" *Position*. Placing the switch on the tuning unit in the "sense" position, brings into play the vertical action of the aerial, *i.e.*, its action with respect to earth.

In consequence of the comparatively small size of an aeroplane's frame aerial system, this non-directional effect is in itself of too great a magnitude to be combined with the directional action of the loops in the required manner, and it is necessary to reduce the current it produces; this is effected by means of the phasing resistance. (See Fig. 1.) The tuning circuit is now influenced by two distinct currents of equal potential but differing in phase.

Rotating the search coil so that the "sense" arrow is placed first to one of the minima found in the D.F. position, and then the other, will result in the practically total elimination of the signals at one of the two points, with a corresponding increase in the strength of those received at the other. Correct phasing has then been effected, resulting in subtraction of the two

effects referred to above in one-half of the 360° sweep, and their addition in the other half.

The polar curve obtained in this case is known as the "cardioid" or heart-shaped curve, and is shown in Fig. 2. The reading taken where the signals are weakest gives the positive bearing of the station received.

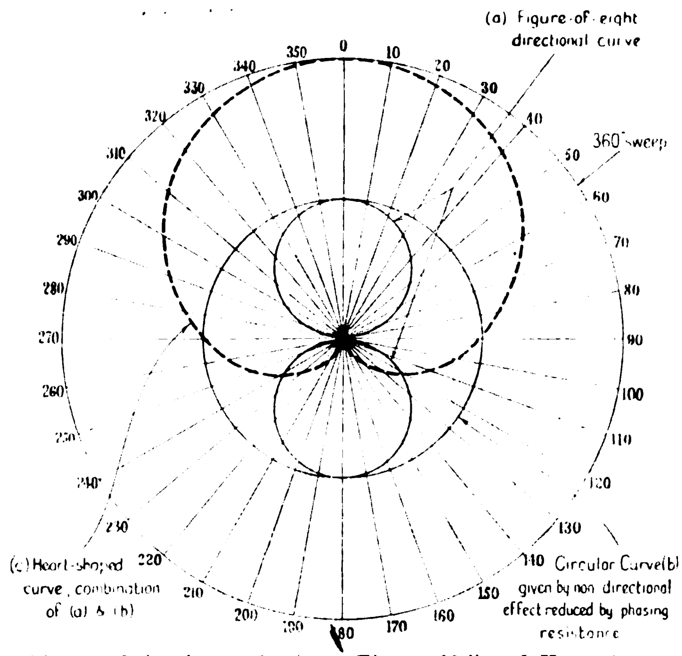

*Fig. 2. Polar Curves showing "**Figure of 8**" and Heart-shaped "Sense" Curve.*

It will thus be possible for a pilot using the installation to fly direct to the aerodrome for which he is making, or, alternatively, to work out his course by taking cross bearings on known stations not necessarily on aerodromes.

The provision of this apparatus will enable him to "make port" even though the ground may be totally obscured by low clouds or fog.

Having once arrived near to the aerodrome by this means, if fog is hanging around and over the landing ground, it will not be possible for him to use his direction finder in the normal manner, since the machine will be moving too fast for him accurately to determine his position.

Rudder Bar Direction Finding. A system is therefore being developed whereby the pilot may *automatically* direct his machine after he has arrived too close to the aerodrome to use the ordinary method of direction finding.

This system will also enable him to fly on a straight course through fogs or clouds, and tend to prevent the danger of getting into a "spin" when the horizon is obscured.

In brief, the principles of this system are :—

The search coil of the D.F. apparatus is coupled to the rudder bar, so that a small movement of that control in an anti-clockwise direction (thus turning the machine to the right) will move the search coil through a much larger arc in a clockwise direction, and *vice versa*.

Thus, assuming that the wireless telephone station is transmitting, and that the ordinary minimum method of D.F. is being employed, if the machine is flying directly towards the aerodrome, no signals will be heard.

If, however, the machine turns off its course, or the rudder is turned so that the machine tends to move off its course, the coil will also move, and as it moves over a larger arc, signals will immediately be heard, thus indicating to the pilot that he is going off his course.

All he then has to do is to move his rudder until signals fall to a minimum again, and by movement of his rudder bar keep the minimum constant.

This will automatically put his machine on the correct course for the aerodrome.

Where there is no wind, there would be no difficulty in flying straight to his destination and landing, but where there is a cross wind, it will be seen that opposing forces come into play. Whereas the automatic D.F. is endeavouring to take the machine straight to the aerodrome, the wind will tend to blow the machine off its course.

A little careful consideration will show that if the pilot uses his D.F. correctly, he will always keep his head towards the aerodrome, and ultimately land "up wind." Fig. 3 shows the resultant course when a wind is blowing directly across the line of flight.

Of course, this method would only be used when the machine is quite near the aerodrome, say from a maximum range of ten miles or so.

It is equally possible to use the maximum method in this manner, but, of course, in this case the pilot must fly on the maximum signal—the search coil being coupled to the rudder bar, at an angle of 90° to that employed on the minimum method. The maximum method has advantages, as the pilot would hear signals all the time he was on the right course, but, obviously, the indications are not as sharp or as accurate as when the minimum method is being employed.

There is no doubt when this system is put into general practice it will greatly assist towards "all-weather flying."

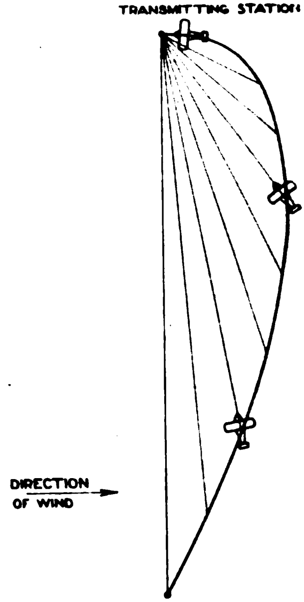

Fig. 3.—Diagram showing course of a machine using "Rudder Bar" Controlled D.F. when the wind is blowing at right angles to its course.

In conclusion, it is worth mentioning that a means has just been perfected and patented by the Marconi Company of eliminating high tension batteries for receiving valves. In the past, it has been the practice to provide a battery of dry cells for supplying the sheaths of the receiving valves with high tension. Now, however, owing to improvement in generator and receiving set design, it has become possible to use high tension direct from the generator for reception.

In the near future, after the wireless telephone has once been installed in the machine, it will be as reliable and as efficient as the ordinary land line, and will need no more attention than actually does the very much maligned Post Office instrument. A striking criticism of the efficiency already obtained is furnished by the pilot of a Cross-Channel Air Liner who complained recently, "What's the matter with the Wireless? I could only hear Croydon from Beauvais to-day!" (Croydon-Beauvais is approximately 160 miles.)

THE MARKING OF AIRCRAFT

(*A*) The nationality mark shall be represented by capital letters in Roman characters—*e.g.*, France, F.

The registration mark shall be represented by a group of four capital letters; each group shall contain at least one vowel, and for this purpose the letter Y shall be considered as a vowel. The complete group of five letters shall be used as a call sign of the particular aircraft in making or receiving signals by wireless telegraphy or other methods of communication, except when opening up communication by means of visual signals, when the usual methods will be employed. The nationality and registration marks are assigned in accordance with the table.

(*B*) On aircraft other than State and commercial, the registration mark shall be underlined with a black line.

TABLE OF MARKS

The nationality mark of the State named below applies to the aircraft of its Dominions, Colonies, Protectorates, Dependencies, or of countries of which it is the Mandatory Power.

Country.	Nationality Mark.	Registration of Marks.
United States of America	N	All communications made in accordance with the provisions of Section 1 (*A*) using a group of four letters out of the 26 of the alphabet, each group containing at least one vowel—*e.g.*, ADCJ, PURN

GENERAL INFORMATION

UNITED STATES OF AMERICA

The Military Air Service is controlled by the War Department of the United States. Below is copy of a letter of instruction from the Office of the Chief of Air Service, dated February 4th, 1920, outlining the indicatives or call letters assigned for the permanent use of the Air Service.

It is proposed, as a part of the 1922 Air Service projects, that long-distance wireless communications stations will be installed and used, both for inter-field communication and for the dissemination of meteorological data to aircraft. It is contemplated that these stations will be located at the following listed fields and stations :—

Mitchel Field, Mineola, L.I., N.Y.
Langley Field, Hampton, Va.
Carlstrom Field, Arcadia, Fla.
Ellington Field, Houston, Tex.
El Paso, Texas.
San Diego, Cal.
Crissy Field, Calif.
Camp Lewis, Wash.
Selfridge Field, Mt. Clemens, Mich.

The Signal Corps is planning the installation of radio stations throughout the United States, for the purpose of disseminating meteorological data to aircraft, which will be received by ground wire from the Weather Bureau officials.

WAR DEPARTMENT.

OFFICE OF THE DIRECTOR OF AIR SERVICE, WASHINGTON.

February 4th, 1920.

LETTER OF INSTRUCTION
No. 2.

To: RADIO OFFICERS, ALL AIR SERVICE ACTIVITIES.

Subject: Radio Call Letters, or Indicatives, for all Air Service Radio Stations.

1. A block of indicatives, or call letters, has been assigned for the permanent use of the Air Service. The indicatives are divided into five main divisions—*i.e.*, V, W, X, Y and Z. The indicatives are to be made up of two letters and one figure. The first letter of the indicative is to be one of the above letters. The five main divisions are assigned as follows:—

Western Department..	VA1 to VZø
Central Department	WA1 to WZø
Eastern and South-Eastern Department	XA1 to XZø
Insular Possessions	YA1 to YZø
Southern Department	ZA1 to ZZø

2. The indicatives will be effective at 00.1 o'clock on April 1st, 1920. Radio officers in charge of Air Service radio stations are responsible for the co-ordination of the change of indicatives with any stations with which they are working.

3. Indicatives for the squadrons will be assigned by the Group Radio Officer under which the squadron is operating, from the block of indicatives assigned to the Group, and indicatives for the airplanes of a squadron will be assigned by the squadron radio officer from the block of indicatives assigned the squadron by the Group Radio Officer.

4. As soon as the blocks of indicatives have been assigned the squadron by the Group Radio Officer, he will send a copy to the Wing Radio Officer, who, in turn, will submit a copy of complete assignment to this Office, through channels.

5. Attached are the assignments of indicatives for Departments, Fields, Wings and Groups, and the reserve indicatives allotted to each.

By direction of the Director of Air Service,

WM. F. PEARSON,
Colonel, A.S.A.,
Administrative Executive.

(a) Reserve—for assignment squadron and airplane	to ..	ZK2 to ZRØ
First Pursuit Group	..	ZS1
(a) Reserve—for assignment squadron and airplane	to ..	ZS2 to ZYØ

The Postal Radio Service is owned and operated by the Post Office Department.

The United States Air Mail Service has been experimenting with aircraft radio since February, 1919. Its principal efforts have been directed to the solution of the problem of Radio Direction Finding and Radio Field Localising. The solution of these problems has been pursued with the aid of the Bureau of Standards and data furnished by the Navy Department, with considerable original research by the Air Mail Service. A simplified Radio Direction Finder, based on the Robinson principle of fixed A and B coils, was evolved, and has been practically applied to single-manned planes of this service. Pilots with no previous experience have flown directly over the radio stations at destination by this means.

The problem of field localising jointly solved by the Air Mail Service and the Bureau of Standards, has resulted in the discovery and practical application of the so-called Radio Frequency Field Localiser System. This system, in brief, consists of two large horizontal single-turn coils in which radio frequency currents flow in opposite directions. As a result, the electro-magnetic field extends upward in an expanding cone. An aeroplane utilising radio direction finding during periods of poor visibility can, of course, fly to the vicinity of the landing field. From this point the field localiser directs them to the immediate vicinity of the field itself.

NOTE : Ø signifies "zero."

During August, 1920, it was found that telegraph communication could not be furnished for the trans-continental Air Mail Service. As a result, it was decided on August 20th to instal a chain of radio stations across the continent, tying in each of the Air Mail fields.

There are eleven of these stations installed on or near various Air Mail fields Those in operation are (1) College Park, Md. 2 kw. Quenched Spark, (2) Bellefonte, Pa. 5 kw. Quenched Spark, (3) Omaha, Neb., 5 kw. Quenched Spark, (4) Cheyenne, Wyo., 2 kw. Arc.

Stations located at the following points have been in operation since October 15th:—(1) Salt Lake City, Utah, 2 kw. Arc; (2) Elko, Nevada, 2 kw. Arc; (3) Reno, Nevada, 2 kw. Arc. The following stations were completed on November 1st, 1920:—(1) St. Louis, Mo., 5 kw. Quenched Spark; (2) North Platte, Nebr., 2 kw. Arc; (3) Rock Springs, Wyo., 2 kw. Arc.

These stations are not only used for inter-station traffic, but are also utilised for aeroplane radio communication and radio direction finding.

It is proposed to utilise all the radio stations of the Air Mail Service for Radio Research work, such as investigation of shifting signals, static and other kindred problems.

GERMANY

The Koenigs Wusterhausen Station (Call Letters, LP) sends out notices for aircraft on a 3,600-metre wave at 1010 and 2010.

Additional information relating to Aircraft Wireless is contained in the Laws and Regulations section.

USEFUL DATA
S E C T I O N

(A) Wireless Terminology : —

(i) Definitions.

(ii) Foreign Equivalents.

(B) General Information and Useful Tables.

USEFUL DATA
WIRELESS TERMINOLOGY
(i) DEFINITIONS.

NOTE.—Terms are generally arranged alphabetically according to the *noun* referred to.

1. AERIAL.—The system of conductors designed to radiate, or absorb electro-magnetic waves.

2. AERIAL CIRCUIT.—The circuit comprising the aerial conductors, the earth conductors, and all inductances and condensers connected between them. As the aerial wires possess capacity with respect to the earth and the aerial conductors themselves possess inductance the aerial circuit has a natural oscillation frequency.

3. AERIAL RESISTANCE.—(See Antenna Resistance.)

4. ÆTHER.—See Ether.

5. ALTERNATING CURRENT.—One which reverses its direction periodically with time, the " periodic time " being the interval between two successive maxima of current in the same direction.

6. ALTERNATOR.—A rotating machine which transforms mechanical energy into electrical energy, producing at its terminals one or more alternating E.M.F.'s (single phase or polyphase).

7. AMMETER (HOT BAND : HOT WIRE).—An ammeter dependent for its indications upon the change in dimensions of an element which is heated by a current through it. In most cases the expansion of the wire is measured by the alteration in the amount of sag.

8. AMMETER, THERMO.—An instrument for measuring current, depending for its indications on the voltage generated at the terminals of a thermo junction heated either directly or indirectly by the current to be measured.

9. AMPERE-TURN is a unit of magneto-motive force. It is $4\pi/10$ gauss. In a solenoid winding it is the product of amperes and number of turns.

10. AMPLIFIER OR AMPLIFYING RELAY.—An instrument which modifies the effect of a local source of energy in accordance with the variations of received energy; and in general produces a larger indication than could be had from the incoming energy alone. Most modern amplifiers consist of arrangements of three-electrode valves in cascade, the inter-valve connections being made by transformers, high resistances or condensers or by combinations of these.

11. AMPLIFIER, HIGH FREQUENCY.—An amplifier designed for the amplification of high or radio frequency oscillations. In a valve amplifier of this type air core transformers are commonly used as the inter-valve connections.

12. AMPLIFIER, LOW FREQUENCY.—An amplifier designed for the amplification of low or audio-frequency signals. In a valve amplifier of this type iron core transformers are commonly used as the inter-valve connections.

13. AMPLIFICATION, CO-EFFICIENT OF.—The ratio of the useful effect obtained by the employment of the amplifier to the useful effect obtained without that instrument. In particular the amplification constant of a thermionic valve may be defined as the ratio of the slopes of the grid voltage—anode current and the anode voltage—anode current characteristics at any operating point.

14. AMPLITUDE.—The maximum value of current or voltage attained during any half period of an alternating current or voltage is called the amplitude during that half period.

15. ANGULAR VELOCITY (or ANGULAR FREQUENCY).—Of a periodic alternating current or voltage is the product of 2π and the frequency in cycles per second.

16. ANODE.—(a) In an electrolytic cell. The conductor through which the current enters the liquid.

(b) In a primary cell. The metal (usually zinc) through which the current enters the electrolyte. It is also termed the negative terminal.

(c) The terminal by which the current enters a cell or other apparatus, such as a vacuum tube, thermionic valve, etc. In a thermionic valve the anode is often termed the "plate," or less commonly the "sheath."

17. ANODE CIRCUIT.—See Plate Circuit.

18. ANTENNA.—See Aerial.

19. ANTENNA, DIRECTIVE.—An antenna having the property of radiating a maximum energy in one (or more) directions.

20. ANTENNA, FLAT TOP.—An antenna having horizontal wires at the top covering a large area.

21. ANTENNA, HARP.—An antenna having an approximately vertical section of large area and considerable width.

22. ANTENNA, INVERTED L.—A flat top antenna in which the leading down wires are taken down from one end of the long horizontal section.

23. ANTENNA, LOOP.—An antenna in which the wires form a closed circuit part of which may be the ground.

24. ANTENNA, PLAIN.—An approximately vertical single wire.

25. ANTENNA, T.—A flat top antenna in which the horizontal section is long and narrow, the leading down wires being taken from the centre.

26. ANTENNA, UMBRELLA.—An antenna the conductors of which form the elements of a cone from the elevated apex of which the leading down wires are brought.

27. ANTENNA RESISTANCE.—Is that resistance which if inserted at the antinode of current in the antenna would dissipate the same power as that radiated by the antenna.

Antenna resistance includes:

(a) Radiation resistance.
(b) Ground or earth resistance.
(c) Radio frequency ohmic resistance of antenna and loading coil and shortening condensers.
(d) Equivalent resistance due to corona, eddy currents, and insulator leakage.
(e) Absorption in neighbouring imperfect dielectrics.

28. APERIODIC CIRCUIT.—A circuit which has no definite time period, this being due either to its resistance being large enough to prevent natural oscillations occurring or to its having no capacity or no inductance and therefore no oscillatory properties.

29. ARC.—"A luminous discharge of electricity through a gas in which the material of one or both the electrodes is volatilised and takes part in the conduction of the current, whether continuous or alternating" (B.E.C.). ARC.—The passage of an electric current of relatively high density through a gas or vapour the conductivity of which is mainly due to the electron emission from the self-heated cathode. Under present practical conditions the phenomena take place near atmospheric pressure (I.R.E.).

30. ARC OSCILLATOR.—An arc used with an oscillating circuit for the conversion of direct to alternating or pulsating current. The oscillations generated are classified as follows:—

Class (1).—Those in which the amplitude of the oscillation circuit current produced is less than the direct current through the arc.

Class (2).—Those in which the amplitude of the oscillation circuit current is at least equal to the direct current, but in which the direction of the current through the arc is never reversed.

Class (3).—Those in which the amplitude of the initial portion of the oscillation circuit current is greater than the direct current passing through the arc, and in which the direction of the current through the arc is periodically reversed.

31. ARRESTER, EARTH.—A spark gap with a small gap and large sparking surfaces; used to protect receiving apparatus from powerful discharges.

32. ASYNCHRONOUS.—" A term applied to an A.C. generator or motor, the speed of which has no fixed relation to the frequency of the current " (I.E.C.).

33. ATMOSPHERIC ABSORPTION.—That portion of the total loss of radiated energy due to atmospheric conductivity, reflection, and refraction.

34. ATMOSPHERICS.—Disturbances produced in the receiving circuits caused by electrical action in the atmosphere or in the earth's surface. They are also known as " X's," " Strays," or " Parasitic Signals," and in the U.S.A. as " Static."

35. ATTENUATION (RADIO).—This is the decrease, with distance from the radiating source, of the amplitude of the electric and magnetic forces constituting an electro-magnetic wave.

36. ATTENUATION, CO-EFFICIENT OF (RADIO).—The co-efficient, which when multiplied by the distance of transmission through a uniform medium, gives the natural logarithm of the ratio of the amplitude of the electric or magnetic force at that distance to the initial value of the corresponding quantity.

37. AUDIBILITY.—The ratio of the telephone current variation producing the received signal to that producing a just audible signal—*i.e.*, one which permits the mere differentiation of dots and dashes.

The measurement of audibility is an arbitrary method for determining the relative loudness of telephone response in radio receivers, in which it is stated that a signal has an audibility of given value. The determination of the above ratio may be made by placing a resistance in parallel with the telephone and reducing its value until the limit of audibility is reached. The audibility of the given signals is then given by $\frac{s+t}{s}$ where s is the impedance of the shunt and t the impedance of the telephone for the frequency and wave-form of the impulses through it.

38. AUTODYNE RECEPTION (also termed ENDODYNE RECEPTION).—A scheme of reception for continuous waves in which the receiver itself generates the local oscillations required for the production of a beat note with the incoming oscillations.

39. AUTO-JIGGER.—See Jigger.

40. AUTOMATIC RECEIVER.—A receiver which records signals so they can be translated at any convenient time after reception.

41. AUTO-TRANSFORMER.—A coil with a core of air or iron in which the primary and secondary windings have a number of turns in common.

42. AUTOMATIC TRANSMITTER.—A transmitter which has the usual operating key replaced by any mechanical telegraph sender such as a Wheatstone transmitter.

43. BALANCING AERIAL.—An aerial used in duplex wireless telegraphy. It fills a purpose similar to that of the artificial line in duplex wire telegraphy.

44. BATTERY.—A primary or secondary cell for producing electric current or a collection of such units. A collection of condenser units.

45. BEAT.—When two oscillations of slightly different frequencies are impressed on an electrical circuit they periodically help and oppose each other. The result is an oscillation the amplitude of which varies in a regular and periodic manner. The time between two successive maxima of amplitude is called the period of the beat. The beat frequency is equal to the difference of the frequencies of the component oscillations.

46. BLUE GLOW.—In a soft thermionic valve is the emission of light which accompanies intense ionisation by collision.

47. Brush Discharge.—"A discharge having a feathery form, and consisting of an intermittent partial discharge which takes place from a conductor when the potential difference exceeds a certain limit, but is not high enough to cause the formation of a true spark or arc. It is always accompanied by a hissing or cracking sound." (I.E.C.). When such a discharge is being given off by a conductor the latter is said to be "Brushing."

48. Brush or Coronal Losses.—Those due to leakage convection electric currents through a gaseous medium.

49. Buzzer.—A small mechanism (usually electromagnetic) used for rapidly making and breaking an electric circuit. When connected in series with part of a circuit in which oscillations are possible it continually impulses the circuit, thereby producing oscillations which are convenient for testing purposes.

50. Cage Conductor.—A group of parallel wires arranged as the elements of a long cylinder.

Note.—Any conducting element of an antenna may be a cage conductor.

51. Capacity.—That property of a material system by virtue of which it is capable of storing energy electrostatically. The capacity of a system is dependent on its geometrical dimensions, its position relative to other conductors and the dielectric constants of the surrounding media.

Capacity is measured by the ratio of the quantity of electricity stored to the potential difference at which it is stored.

A distinctive property of a capacity is that it permits the passage of electrical energy through it only in the form of displacement currents. The reactance of a capacity C for such currents is equal to $\frac{1}{Cp}$ where p is the angular frequency of the alternating current.

52. Capacity, Effective, of an Antenna.—The effective capacity and effective inductance of an antenna at any oscillation frequency are the equivalent capacity and inductance values determined from the following fundamental equations:

$$\omega = \sqrt{\frac{1}{LC}} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \qquad (1)$$

where L = the total antenna inductance.
C = the total antenna capacity,
ω = the angular velocity of the free alternating currents in the antenna

$$d = \pi R \sqrt{\frac{C}{L}} \quad . \quad . \quad . \quad . \quad . \qquad (2)$$

or

$$d' = \pi R' \sqrt{\frac{C}{L}} \quad . \quad . \quad . \quad . \quad . \qquad (2a)$$

where R' = series resistance inserted at the base of the antenna and
d' = increased decrement resulting therefrom.

Solving (1) and (2a) for L and C, we have

$$L = \frac{\pi R'}{\omega d'} = \frac{R'}{6 \times 10^8 \times d'} \cdot \lambda \qquad (\lambda \text{ in metres}).$$

$$C = \frac{d'}{R'} = \frac{d'}{6\pi^2 \times 10^8 \times R'} \cdot \lambda \qquad (\lambda \text{ in metres})$$

Having the antenna inductance and capacity, the resistance R of the antenna can be determined from equation (2). This value of R satisfies the fundamental equation :

RI^2 = power absorbed by the antenna,
where I = current measured at the base of the antenna.

NOTE.—The equation

$$I = \omega CE$$

$$\left(\text{and also } E = \frac{\pi R'}{d'} \cdot I\right)$$

defines an effective voltage E, which is the voltage approximately given by the equation. Energy per spark $= \frac{1}{2}CE^2$.

A useful approximate formula for the fundamental wavelength of an inverted L antenna is the following :

$$\lambda \text{ (metres)} = 1{,}884 \sqrt{\left(L + \frac{L_o}{3}\right) C_o}$$

where C_o is calculated static capacity,
L_o is ordinary calculated inductance in microhenries.
L is inductance of loading coil in microhenries.

53. CATHODE.—See Kathode.

54. CATHODE OF THERMIONIC VALVE.—See Filament.

55. CENTRE OF CAPACITY OF AN ANTENNA.—See Form Factor, Note 2.

56. CHANGER, FREQUENCY.—A device delivering alternating currents at a frequency which is some multiple of frequency of the supply current.

57. CHANGER, WAVE.—A transmitting device for rapidly and positively changing the wavelength.

58. CHARACTERISTIC CURVE.—A curve showing the variation of a property of a material or a piece of apparatus when submitted to a changing influence which produces that variation.

The characteristic curves of a thermionic valve or arc or crystal show the relations between the various applied potentials and resulting currents.

59. CHARACTERISTIC, DYNAMIC, OF A CONDUCTOR (for a given frequency and between given extremes of impressed E.M.F. and resultant current through the conductor).—This is the relation given by the curve obtained when the impressed E.M.F.'s are plotted as ordinates against the resultant currents as abscissas, both E.M.F.'s and currents varying at the given frequency and between the given extremes.

60. CHARACTERISTIC, STATIC, OF A CONDUCTOR.—This is the relation given by the curve plotted between the impressed electromotive force as ordinates and the resultant current through the conductor as abscissas, for substantially stationary conditions.

61. CHOKING COIL.—" A coil with so great a self-induction that its impedance depends chiefly on the self-induction rather than upon the resistance " (I.E.C.). Generally called a Reactance Coil in U.S.A.

62. CIRCUIT, CLOSED OSCILLATING.—A circuit in which the capacity and inductance in series are localised substantially in different places, and which has very small power of radiating electromagnetic waves.

63. CO-EFFICIENT, ATTENUATION, RADIO.—See Attenuation.

64. CO-EFFICIENT OF AMPLIFICATION.—See Amplification.

65. CO-EFFICIENT OF COUPLING, INDUCTIVE.—The ratio of the effective mutual inductance of two circuits to the square root of the product of the effective self-inductances of each of these circuits.

66. CODE.—A system of conventional characters designed to represent letters by dots and dashes. The International Morse Code is official.

67. COHERER.—A form of detector (q.v.). An imperfect contact or collection of such contacts so arranged that when under the influence of an alternating potential it coheres and allows current from a local battery to pass and make some kind of signal. A device sensitive to radio frequency energy, and characterised by (1) a normally high resistance to currents at low voltages, (2) a reduction in resistance on the application of an increasing electromotive force, this reduction persisting until eliminated by the application of a restoring or disturbing mechanical force, and (3) the substantial absence of thermo-electric or rectifying action.

68. COMMUNICATION RADIO.—The transmission of signals by means of electromagnetic waves originating in a constructed circuit.

69. COMPASS RADIO.—A radio receiving device for determining the direction (or the direction and its opposite) in which maximum energy is received ; or

A radio transmitting device for determining the direction (or the direction and its opposite) of maximum radiation.

70. CONDENSER.—A material system possessing electrostatic capacity. Two conducting surfaces separated by a dielectric.

71. CONDENSER, AIR.—A condenser having air as its dielectric.

72. CONDENSER, COMPRESSED GAS.—A condenser having compressed gas as its dielectric.

73. CONDUCTOR CAGE.—See Cage Conductor.

74. CONJUGATE MUTUAL CONDUCTANCE of a thermionic valve is given by the slope of the anode voltage-grid current characteristic at any operating point.

75. CONTINUOUS CURRENT.—A term recommended by the I.E.C. to supersede " direct current " as a description of " an electric current in one direction and sensibly steady or free from pulsation. Abbreviated CC."

76. CONTINUOUS WAVES.—The term applied to waves radiated from an aerial in which oscillations are sustained. Continuous waves may have successive half periods of equal amplitude, or the amplitude may vary within small limits without detriment to their use for wireless telegraphy.

77. CONTROL ELECTRODE OF THERMIONIC VALVE.—See Grid.

78. CONVECTION CURRENT.—A transfer of electrical energy by separate charged particles.

79. CONVERTER, ROTARY.—A machine for converting electrical energy of one form of current to electrical energy of another form, such as from alternating current to continuous or *vice versa.*

80. CORONA.—See Brush or Coronal Losses.

81. COUNTERPOISE.—A system of electrical conductors forming one portion of a radiating oscillator the other portion of which is the antenna. In land stations, a counterpoise forms a capacitive connection to ground.

82. COUPLER.—An apparatus which is used to transfer radio frequency energy from one circuit to another by associating portions of these circuits.

83. COUPLER, CAPACITIVE.—An apparatus which, by electric fields, joins portions of two radio frequency circuits, and which is used to transfer electrical energy between these circuits through the action of electric forces.

84. COUPLER, DIRECT.—A coupler which magnetically joins two circuits having a common conductive portion.

85. COUPLER, INDUCTIVE.—An apparatus which by magnetic forces joins portions of two radio frequency circuits.

86. COUPLING.—The connection between two circuits enabling energy to be transferred from one to the other. The connection may be by magnetic inkage, electrostatic linkage, direct connection, or any combination of these.

87. COUPLING, CO-EFFICIENT OF, in inductively coupled system is the ratio of the mutual inductance of the two circuits to the square root of the product of the self-inductance of the circuits. The coefficient of coupling (k) between two circuits tuned to the same frequency and then coupled, is also given by the formula :—

$$k = \frac{\lambda_1^2 - \lambda_2^2}{\lambda_1^2 + \lambda^2}$$

where $\lambda_1 \lambda_2$ are the longer and shorter resulting natural wavelengths of the coupled system.

88. CRITICAL RESISTANCE.—That resistance which is just sufficient to prevent free oscillation in an electrical circuit. If L inductance,

C Capacity, then Critical Resistance $= \sqrt{\frac{4L}{C}}$.

89. CRYSTAL DETECTOR.—A detector which uses the rectifying properties of the contact between a crystal and a metal surface or between two crystals.

90. CURRENT, DAMPED ALTERNATING.—An alternating current whose amplitude progressively diminishes. (Also called oscillating current.)

91. CURRENT, FORCED ALTERNATING.—A current, the frequency and damping of which are equal to the frequency and damping of the exciting electromotive force. See further, Current, Free Alternating.

NOTE I.—During the initial stages of excitation, both free and forced currents co-exist.

92. CURRENT, FREE ALTERNATING.—The current following any transient electromagnetic disturbance in a circuit having capacity, inductance, and *less* than the critical resistance. See further, Resistance, Critical.

93. CURVE, DISTRIBUTION, OF A RADIO TRANSMITTING STATION FOR A GIVEN DISTANCE.—This is a polar curve the radii vectores of which are proportional to the field intensity of the radiation at that distance in corresponding directions. See also Compass, Radio.

NOTE I.—The distribution curve depends, in general, not only on the form of the antenna, but also on the nature of the ground surrounding the station.

NOTE 2.—The distribution curve generally varies with the distance from the station.

94. CURVE, RESONANCE, STANDARD.—A curve the ordinates of which are the ratios of the square of the current at any frequency to the square of the resonant current, and the abscissas are the ratios of the corresponding wavelength to the resonant wavelength ; the abscissas and ordinates having the same scale.

95. CYCLOGRAM.—See Characteristic Dynamic.

96. CYCLOGRAPH.—An instrument for the production of cyclograms.

97. CYMOMETER.—A " wave-measurer." See Wavemeter.

98. DAMPING.—The diminution of energy in an electrical circuit resulting from loss of energy.

99. DAMPING FACTOR (of a simple circuit).—The ratio of the effective resistance of that circuit to twice the effective inductance (the reciprocal of a time). This term applies only to circuits capable of carrying free alternating currents.

100. DECREMENT.—See Decrement, Linear, and Logarithmic.

101. DECREMENT, OF A LINEARLY DAMPED ALTERNATING CURRENT.—This is the difference of successive current amplitudes in the same direction divided by the larger of these amplitudes.

NOTE.—Let I_n and I_{n+1} be successive current amplitudes in the same direction of a linearlv damped alternating current.

Then, the linear decrement, which is not a constant but varies with the amplitude,

$$b=\frac{I\ -I_{n+1}}{I_n}$$

Also: $I_t=I_o\ (1-bft)$,
where I_o = initial current amplitude,
I_t = current amplitude at time t,
f = frequency of alternating current,
$b=(I_0-I_1)\ I_0$.

102. DECREMETER.—An instrument for measuring the logarithmic decrement of a circuit or of a train of electromagnetic waves.

103. DETECTOR.—That portion of the receiving apparatus which, connected to a circuit carrying currents of radio frequency, and in conjunction with a self-contained or separate indicator, translates the radio frequency energy into a form suitable for operation of the indicator. This translation may be effected either by the conversion of the radio frequency energy, or by means of the control of local energy by the energy received.

104. DEVICE, ACOUSTIC RESONANCE.—A device which utilises in its operation resonance to the audio frequency of the received signals.

105. DIELECTRIC.—Any medium which will only allow of electric conduction to a small or negligible extent.

106. DIELECTRIC CONSTANT (or Specific Inductive Capacity) of a medium. The ratio of the capacity of a condenser having that medium as a dielectric to the capacity of a condenser having a vacuum dielectric, but otherwise identical. (The dielectric constant of air is substantially unity, and therefore for all practical purposes air may be used in place of the vacuum in the comparison condenser.)

107. DIELECTRIC HYSTERESIS.—That lagging property of a dielectric which is measured by the energy lost when the rising and falling (displacement current)—(Voltage) characteristics (dynamic) are not identical.

108. DIELECTRIC HYSTERETIC CONSTANT of a given dielectric. The value of the dielectric hysteresis per cycle per unit of potential gradient applied to the dielectric.

109. DIFFRACTION is the deviation of the direction of propagaticn of a wave from the normal to the wave front at the point where the waves pass the edge of an obstruction. The amount of diffraction depends on the wavelength and increases with increase of wavelength.

110. DIPLEX TELEGRAPHY is the simultaneous transmission or the simultaneous reception of two messages at the same station.

111. DIRECT COUPLING.—When one circuit is linked to another in such a way that a portion of the one forms part of the other they are said to be direct-coupled. An example is provided in the auto-jigger (*vide* Jigger), in which a portion of the inductance is common to two circuits.

112. DIRECTION FINDER, WIRELESS.—A receiving instrument which, in combination with a special aerial system, enables the direction of the transmitting station to be determined.

113. DISC DISCHARGER, ASYNCHRONOUS.—A disc discharger the speed of which has no fixed relation to the frequency of the current charging the condenser which it discharges.

114. DISC DISCHARGER, SYNCHRONOUS.—A disc discharger usually directly coupled to the alternator supplying power to the condenser. It may discharge the condenser, one, two, three, or more times during a half-period; or every one, two, or more half-periods. The usual practice is to discharge once every half-period, at the moment when the condenser potential is a maximum, and the alternator current zero.

115. Disruptive Voltage.—The voltage required to break down a piece of dielectric between a given pair of electrodes.

116. Discharger.—That piece of apparatus in the primary oscillating circuit at which the spark takes place.

117. Duplex Telegraphy.—Is the transmission of a message and the reception of a message simultaneously at the same station.

118. Displacement Current.—The electrical condition within a dielectric region of varying electric stress. It produces the same external electric and magnetic effects as the equivalent conduction current.

119. Dynatron.—A three-electrode thermionic tube which depends for its action on the liberation of electrons from the anode by electronic bombardment.

120. Earth Connection, or "Earth."—The connection to the earth which in most systems forms the lower extremity of the Aerial System (q.v.). It usually takes the form of a system of metal plates or wires, or a combination of both, more or less deeply buried in the ground. (U.S. equivalent, Ground.)

121. Eddy Currents.—Those induced in conducting masses by external varying magnetic fields, the location of these currents being primarily determined by the position of the fields and not by the configuration of the conducting masses. (That is, the conducting mass is not specially arranged to provide perfectly well-defined circuits.) Such parasitic currents are also called Foucault currents. They can be minimised by using stranded or laminated conductors.

122. Electric Potential is defined as the work done in carrying a unit charge of electricity from infinity to the point considered. (See Electromotive Force.)

123. Electric Stress.—The cause of the electrically strained condition in the medium between two regions which are at different potentials.

124. Electromagnetic Wave.—A progressive disturbance characterised by the existence on the wave front of electric and magnetic forces acting in directions which are perpendicular to each other and to the direction of propagation of the wave.

125. Electromotive Force.—The force which tends to displace electricity, and is equal to the difference of potential between the points considered.

126. Electron.—The natural unit of negative electricity (4.774×10^{-10} electrostatic units).

127. Endodyne Reception.—See Autodyne Reception.

128. Ether.—The medium assumed by electromagnetic theory in order to explain the translation of energy at finite speed by electromagnetic waves.

129. Excitation, Impulse.—A method of producing free alternating currents in an excited circuit in which the duration of the exciting current is short compared with the duration of the excited current.

Note.—The condition of short duration implies that there can be no appreciable reaction between the circuits.

130. Factor, Damping.—The product of the logarithmic decrement and the frequency of an exponentially damped alternating current.

Let I_o = initial amplitude,
I_t = amplitude at the time t,
ϵ = base of Napierian logarithms (2.718+)
a = damping factor.

Then, $I_t = I_o \epsilon^{-at}$.

131. Factor, Form.—The form factor of a symmetrical antenna for a given wavelength is the ratio of the algebraic average value of the R.M.S. currents measured at all heights to the greatest of these R.M.S. currents.

Note 1.—For a given R.M.S. current at the base of the antenna, the field intensity at distant points is proportional to the form factor times the height of the antenna.

NOTE 2.—The effective height (height of centre of capacity) is equal to the form factor times the actual height of the antenna.

NOTE 3.—The limiting values of the form factor for various types of antennas are as follows:

	LINEAR OR VERTICAL ANTENNA	FLAT TOP UMBRELLA ANTENNA
Long Waves	Lower Limit, 1/2	Upper Limit, 1
Fundamental	Lower Limit, $2/\pi$	———

NOTE 4.—The form factor varies in a given antenna at various wavelengths due to variation of the current distribution.

132. FILAMENT BATTERY OF THERMIONIC VALVE.—The battery by which the filament is electrically heated to incandescence.

133. FILAMENT OF THERMIONIC VALVE.—A thin conductor of meta (usually tungsten in modern valves) or carbon which when rendered incandescent emits electrons.

134. FORCED ALTERNATING CURRENT.—One produced in *any* circuit by the application of an alternating electromotive force.

135. FREE ALTERNATING CURRENT.—That produced by an isolated electrical displacement in a circuit having capacity, inductance, and less than the critical resistance.

136. FREQUENCY.—A term used in connection with any form of rhythmical motion or rhythmical change, denoting the number of complete movements or changes in a given time—usually a second.

137. FREQUENCIES, AUDIO (ABBREVIATED A.F.).—The frequencies corresponding to the normally audible vibrations. These are assumed to lie below 10,000 cycles per second.

138. FREQUENCIES, RADIO (ABBREVIATED R.F.).—The frequencies higher than those corresponding to the normally audible vibrations, which are generally taken as 10,000 cycles per second. See also Frequencies, Audio.

NOTE.—It is not implied that radiation cannot be secured at lower frequencies, and the distinction from audio frequencies is merely one of definition based on convenience.

139. FREQUENCY CHANGER.—See Changer, Frequency.

140. FREQUENCY, GROUP.—The number per second of periodic changes of amplitude or frequency of an alternating current.

NOTE 1.—Where there is more than one periodically recurrent change of amplitude, or frequency, there is more than one group frequency present.

NOTE 2.—The term "group frequency" replaces the term "spark frequency."

141. FREQUENCY METER.—An instrument which indicates frequency.

142. FREQUENCY TRANSFORMER.—See Changer, Frequency.

143. FUNDAMENTAL FREQUENCY.—The lowest frequency to which an electrical circuit will resonate.

144. FUNDAMENTAL OF AN ANTENNA.—This is the lowest frequency of free oscillations of the unloaded antenna. (No series inductance or capacity.)

145. FUNDAMENTAL WAVELENGTH.—The wavelength corresponding to the lowest free period of any oscillator.

146. GAP, MICROMETER.—A device for protecting any apparatus from excessive potentials, and consisting of a short gap designed for fine adjustment.

147. GRID OF THERMIONIC VALVE.—Is a perforated metal electrode by means of which it is possible (by suitable charging) to disturb the state of the electric field between the filament and the metal anode and so control the value of the thermionic current.

148. GRID CIRCUIT OF THERMIONIC VALVE.—The circuit which includes the space in the valve from grid to filament and the path of the external conductor from filament to grid.

149. GRID CONDENSER.—A partially insulated condenser placed in the grid circuit of a thermionic valve which, on account of the approximately unilateral conductivity of the grid circuit, produces asymmetrical variations of anode current for symmetrical applied grid voltage changes.

150. GROUND.—A conductive connection to the earth.

151. GROUP FREQUENCY.—The number of distinguishable alternating current groups occurring per second in an electrical circuit.

NOTE 1.—The group referred to above is, in general, mainly a free alternating current which is substantially damped to extinction before the beginning of the following group or train.

NOTE 2.—The pitch of the note in the receiving station is, in general, determined by the group frequency at the transmitting station.

NOTE 3.—The term "Group Frequency" replaces the term "Spark Frequency."

152. HARD VALVE.—A two or three-electrode valve of extreme exhaustion.

153. HARMONIC FREQUENCY.—The harmonics of any particular frequency are generally understood to be all higher frequencies which are odd, or even multiples of the said frequency. An electrical oscillator which has uniformly distributed inductance and capacity (a straight wire nearly fulfils these conditions) will resonate to any odd or even multiple of its fundamental frequency according to whether one end is earthed or not. If the inductance and capacity are not uniformly distributed the circuit may resonate to a number of frequencies higher than its fundamental, but these higher frequencies will not necessarily bear any whole multiple relation to the fundamental frequency.

154. HEIGHT, EFFECTIVE, OF AN ANTENNA.—See Factor, Form; Note 2.

155. HETERODYNE.—A receiver for continuous waves using the principle of reaction between locally generated oscillations and the received oscillations in order to produce beats.

156. HETERODYNE WAVEMETER.—A valve oscillator the oscillatory circuit of which is calibrated in wavelengths. Syntony between the calibrated and experimental circuits is obtained by tuning until no beats are heard.

157. HIGH-FREQUENCY RESISTANCE.—The resistance offered by a conductor to the passage of high-frequency currents.

It is always greater than the resistance for direct current because of the unequal current distribution over a section of the conductor when carrying high-frequency currents.

158. HIGH-TENSION BATTERY.—The battery used in the anode circuit of a thermionic valve.

159. HYSTERESIS.—A property of a substance or body by virtue of which an effect produced in a body by changing conditions lags behind the conditions. In the case of iron carried through a magnetic cycle, the magnetisation lags behind the magnetising force.

160. IMPEDANCE.—Total opposition to current flow in a circuit in which the current is varying, and is numerically equal to the square root of the sum of the squares of the ohmic resistance and the total reactance of the circuit.

161. IMPULSE EXCITATION.—See Excitation, Impulse.

162. INDUCTANCE, MUTUAL, between two circuits is, in the e.m. system of units, equal to the number of lines linked with one circuit due to unit current in the other (see "Inductance, Self," for explanation of "linked with"). The unit current may be supposed in either circuit, provided that it is the same at all parts of its circuit.

The mutual electrokinetic energy of two circuits carrying currents is the continued product of the currents and the mutual inductance in any consistent system of units.

INDUCTANCE, SELF, of a circuit is the electrical analogue of inertia or mass when current is taken as the analogue of velocity. In terms of magnetic

induction the inductance of a circuit in the e.m. system of units is equal to the number of lines linked with the circuit due to unit current in the circuit; "linked with" means here that a line is counted each time it threads the circuit (or each time the circuit threads it), plus being given to one sense and minus to the other

The inductance of a coil is indefinite when there is a magnetic core, because hystersis renders the flux indefinite, and is also indefinite when the current is different at different parts of the circuit, as occurs, for example, when stationary waves arise because of distributed capacity.

Co-efficient of Self Induction is often used as a synonym for Self-Inductance.

163. Inductance, Effective, of an Antenna.—See Capacity, Effective, of an Antenna.

164. Induction Coil.—A piece of apparatus which makes use of the phenomena of induction to transform an intermittent current of comparatively low voltage to an alternating current of high voltage.

165. Inductive Coupling.—Two circuits so arranged that some of the lines of force from one passing through the other circuit are inductively coupled.

166. Interference.—The interaction of two alternating currents or of electro-magnetic waves under conditions such that they oppose each other.

167. Interference (in reception).—The introduction of undesired signals, either from other stations or from Atmospherics (q.v.), into a receiver which is engaged in the reception of a message; often referred to as "jamming."

168. Interference, Wave (in Radio Communication).—The reinforcement or neutralisation of waves arriving at a receiving point along different paths from a given sending station (to be distinguished from ordinary or station interference, which is the simultaneous reception of signals from two or more stations).

169. Ionisation of a Gas.—The breaking away from the molecules of the ions contained in them, thus rendering the gas conductive.

Ionisation in gases may be brought about by various ionising agents—*e.g.*, X-rays, ultra-violet light, or high-speed electrons.

170. Ionisation by Collision.—The liberation of electrons from the atoms of a gas due to the collisions between the atoms and high-speed electrons.

171. Jamming.—See Interference (in Reception).

172. Jigger.—The transformer used in coupled circuits. The primary and secondary form part of the primary and secondary circuits respectively. If the transformer has part of the winding common to both primary and secondary, it is called an Auto-Jigger.

173. Kallirotron.—A form of aperiodic retroactive amplifier consisting of two thermionic valves so connected by pure resistances that a rise of grid potential of either produces a fall of grid potential of the other. The amplification obtained exceeds the amplification factor of either valve by any desired amount according to the extent of the retroaction.

174. Kathode.—" (*a*) In an electrolytic cell. The conductor through the surface of which the current leaves the electrolyte.

" (*b*) In a primary cell. The conductor (generally carbon) through which the current leaves the electrolyte.

" (*c*) The electrode by which the current leaves a cell or other apparatus, such as a vacuum tube or thermionic valve."

175. Key (Manipulating) (Operating).—A switch arranged for easy manual operation.

176. Key, Relay.—See Relay Key.

177. Length, Wave.—See Wavelength.

178. Line of Force.—A curve described in an electric or magnetic field such that the direction of the electric or magnetic force at any point of that curve is a tangent to the curve.

179. Loading Coil.—A coil possessing self-inductance inserted in an aerial circuit to increase the natural wavelength of the circuit.

180. Losses, Brush or Corona.—See Brush or Corona Losses.

181. Low-Tension Battery.—See Filament Battery.

182. Magnetic Field Intensity.—The number of lines of force per unit area.

183. Magnetic Force.—At a point. The force acting on a unit magnetic pole placed at that point. It is numerically equal to the field intensity in a medium of unit permeability.

184. Magnetic Hysteresis.—That property of a magnetic medium which is measured by the energy losses when the rising and falling (magneto-motive force—induction), *i.e.* (H—B), dynamic characteristics are not identical.

185. Magnetomotive Force.—A force tending to produce a magnetic flux.

186. Magnetic Detector (Marconi's).—A detector of oscillations depending on the effect on the hysteresis of iron.

187. Microphone.—A variable resistance, usually in the form of an electrical contact, whose resistance is varied with and in a proportional manner to the movement or pressure of one part. Thus if the movement or pressure is produced by sound waves acting on a diaphragm which is connected to the moving member of the microphone, an electrical current will be produced in the circuit containing the microphone and a battery, whose amplitude varies in a similar manner to the movement of the diaphragm.

188. Mutual Conductance of a thermionic valve is given by the slope of the grid voltage—anode current characteristic at any operating point.

189. Mutual Inductance.—See Inductance, Mutual.

190. Natural Frequency.—Is the frequency with which a circuit will oscillate when supplied with energy and then left to itself.

191. Natural Frequency of Antenna.—See Capacity, Effective, of an Antenna.

192. Note or Tone Tuning.—A receiver is tuned to the note of the transmitter when a circuit or part of the indicator is designed to resonate to the spark frequency.

193. Oscillating Valve.—A thermionic valve in a circuit which is electrically unstable and generating continuous oscillations.

194. Oscillations.—See Alternating Currents, Free and Forced, also Current, Damped Alternating.

195. Oscillator, Arc.—See Arc Oscillator.

196. Oscillograph.—" An apparatus for observing or recording quickly varying currents or potential differences " (B.E.C.).

197. Period, Periodic Time.—" Any varying quantity which repeats its values regularly at equal time intervals is said to be periodic, and the time-interval of one repetition is called the periodic time or period " (B.E.C.).

198 Permeability of a medium.—The ratio of the magnetic flux density produced in that medium by a given magnetomotive force to the magnetic flux density produced by the same magnetomotive force in vacuum (or, for practical purposes, in air).

199. Phase.—" (*a*) In an operation which recurs periodically the stage or state to which the operation has proceeded.

" (*b*) In an operation which recurs periodically the fraction of the whole period which has elapsed, measured from some fixed origin " (B.E.C.).

200. PHASE DIFFERENCE.—" The difference of phase (usually reckoned in time or in angle) between two periodic quantities which vary harmonically. Each of the circuits of a polyphase apparatus is sometimes called a phase" (B.E.C.).

201. PLAIN AERIAL.—An early form of transmitter in which the spark gap was placed directly in series with aerial and earth, so that the only condenser in which the energy of the transmitter could be stored was the capacity of the aerial to earth.

The term is also applied to the receiving circuit when the detector is placed directly in series with the receiving aerial and earth.

202. PLATE.—See Anode.

203. PLATE CIRCUIT.—Is the circuit in a thermionic valve which includes the space in the valve from plate to filament and the path through the external conductors from filament to plate.

204. PLIODYNATRON.—A combination of a pliotron and a dynatron, being a four-electrode thermionic tube. The output is controlled by the control grid which is between the filament and the heavier grid-anode.

205. PLIOTRON.—A three-electrode valve of extreme exhaustion.

206. POLARISATION of a wave.—A wave is said to be plane polarised when its electric and magnetic displacements are confined to two fixed planes at right angles.

When the plane of the electric and magnetic displacement rotates uniformly with time, the waves are said to be circularly or eliptically polarised.

Such waves result from the compounding of two plane polarised waves having the same frequency and line of propagation but different relative phases and polarised in different planes.

207. POTENTIOMETER.—An instrument for adjusting at will the potential between any two parts of a circuit.

An instrument for measuring potential difference.

208. POTENTIAL.—See Electrical Potential.

209. POWER.—The amount of work done in unit time.

210. POWER, APPARENT.—In an alternating electric circuit this is the product volts × amperes.

211. POWER FACTOR.—" The ratio of the watts to the voltampères. In the case of voltage and current of sine form the power factor is cos φ " (B.E.C.). In an oscillating circuit $\cos \varphi = \frac{\delta}{\pi}$ where δ is the decrement.

212. QUENCHED SPARK.—A spark whose duration is shortened by conditions at the discharger designed to increase rapidly the resistance at the spark gap is said to be " quenched."

213. RADIATION RESISTANCE.—The resistance which multiplied by the square of the R.M.S. current in the aerial equals the energy lost by the aerial in radiation.

214. RADIATION, SUSTAINED.—See Waves, Sustained.

215. RADIOGRAM.—A telegram sent by radio.

216. TO RADIOGRAPH (VERB).—To send a radiogram.

217. RADIOTELEPHONE.—An apparatus for the transmission of speech by radio.

218. RADIO PHONE (NOUN).—A telephone message sent by radio.

219. TO RADIOPHONE (VERB).—To send a radiophone.

220. REACTANCE of a circuit is a function of the inductance, capacity, and the impressed frequency.

An inductance has reactance $2 \pi \times$ frequency $\times$ inductance.

A capacity has reactance

$$\frac{1}{2\pi \times \text{frequency} \times \text{capacity}}$$

An inductance in series with a capacity has reactance equal to the sum of the reactance of the inductance and the reactance of the condenser.

Under conditions of resonance in a circuit the reactance of the capacity neutralises the reactance of the inductance and the resulting reactance is zero.

221. Rectifier.—An apparatus for converting alternating or oscillating currents into continuous current, or into pulses of unidirectional current. Rectifier, Electron.—A device for rectifying an alternating current by utilising the approximately unilateral conductivity between a hot cathode and a relatively cold anode in so high a vacuum that a pure electron current flows between the electrodes. See also Kenetron.

222. Rectifier, Gas.—An electron rectifier containing gas which modifies the internal action by the retardation of the electrons or the ionisation of the gas atoms.

223. Reflection of Electromagnetic Waves.—(1) When a wave reaches the interface between two media of different dielectric constants its energy does not wholly pass from one medium to the other, but in part remains in the first medium in a reflected wave which travels back from the interface. When the dimensions of the separating surface are large compared with the wavelength the laws of reflection of electromagnetic waves are in general the same as for light.

(2) When waves are being guided by a conductor, such as a wire which has a certain inductance and capacity per unit length, any abrupt change in the value of these constants (such as are produced by inserting an inductance coil, or occur at the end of the wire) causes the production of alternating potentials which result in a wave which travels along the wire in the opposite direction. This second wave is also called a reflected wave.

224. Refraction.—The change in the direction of a wave propagation when passing from one medium to another.

225. Regenerative or Retroactive Amplification.—Amplification obtained in a thermionic valve by causing the energy variations of the anode circuit to feed back into the grid circuit and thus increase the voltage operating on the grid.

226. Relay.—An apparatus by means of which a current, too small to perform a required work, is made to control a larger and adequate current.

227. Relay, Electron.—A device provided with means for modifying the pure electron current flowing between a hot cathode and a relatively cold anode placed in as nearly as possible a perfect vacuum.

These means may be, for example, an electric control of the pure electron current by variation of the potential of a grid interposed between the cathode and the anode.

228. Relay, Gas.—An electron relay containing gas which modifies the internal action by the retardation of the electrons or the ionisation of the gas atoms.

229. Relay Key.—An electrically operated key. See further, Key.

230. Resistance.—The measure of that property of a conductor by the action of which electrical energy is transformed into heat in that conductor. It is numerically equal to the ratio of the heat energy liberated per second, measured in watts, to the square of the current in the circuit, for stationary conditions; it is also equal to the ratio of the applied electromotive force to the resulting current, both being constant.

231. Resistance, Antenna.—See Antenna Resistance.

232. Resistance, Critical, of a Circuit.—That resistance which determines the limiting condition at which the oscillatory discharge of a circuit passes into an aperiodic discharge.

233. Resistance, Effective, of a Spark.—The ratio of the power dissipated by the spark to the mean square current.

234. Resistance, Radiation.—This is the ratio of the total energy radiated (per second) by the antenna to the square of the R.M.S. current at a potential node (generally the ground connection). See further, Antenna, Resistance.

235. Resistance, Radio Frequency.—This is the ratio of the heat produced per second in watts to the square of the R.M.S. current (R.F.) in amperes in a conductor.

236. Resonance.—Resonance of a circuit to a given exciting alternating E.M.F. is that condition due to variation of the inductance or capacity in which the resulting effective current (or voltage) in that circuit is a maximum.

Note 1.—Instead of varying the inductance and capacity of a circuit the frequency of the exciting field may be varied. The condition of resonance is determined by the frequency at which the current (or voltage) is a maximum.

Note 2.—The resonance frequency corresponds the more accurately to the frequency of the free oscillations of a circuit, the lower the damping of the exciting alternating field and of the excited circuit.

A circuit will resonate to an impressed frequency when the reciprocal of 2π times the square root of the product of inductance and capacity is equal to the impressed frequency and provided that its resistance is less than the critical resistance. Under conditions of resonance the amplitudes of successive half-periods of the resultant current gradually increase to a maximum which is dependent only on the impressed electromotive force and the resistance of the circuit, including radiation.

237. Resonance, Acoustic Device.—See Device, Acoustic Resonance.

238. Resonance Curve.—A curve showing the relation between the current or voltage induced in an oscillatory circuit and the inducing frequency.

239. Resonance, Sharpness of.—See Tuning, Sharpness of.

240. Retroactive Amplification.—See Regenerative Amplification.

241. Root-Mean-Square Value.—R.M.S. value of an alternating or oscillating current or voltage is the value given by the square root of the mean of the squares of the successive values throughout the half-period.

In a current or voltage of strict sine-wave form (sinusoidal) the R.M.S. value is equal to the maximum multiplied by ·707—*i.e.*, $(1/\sqrt{2})$. The R.M.S. value is also called the effective or virtual value.

242. Selectivity.—The power of a receiving system to discriminate between a number of simultaneous signals.

243. Self-Inductance of a circuit.—See Inductance, Self.

244. Sharpness of Tuning.—The measure of the rate of diminution of current in transmitters and receivers with detuning of the circuit which is varied.

If d_2 is the decrement of the free alternating current in the circuit and d_1 the decrement of the exciting E.M.F., then the sharpness of tuning is arbitrarily defined as $\frac{\pi}{d_1 + d_2}$.

In the case of continuous oscillations this reduces to $\frac{\pi}{d_2}$.

245. Sheath.—The anode or plate of a thermionic valve.

246. Shock Excitation.—A name given to the method of exciting oscillations in the aerial circuit by a sudden and very short transference of energy from another circuit.

247. Shortening Condenser.—A condenser inserted in series with an aerial circuit to decrease the natural wavelength of the circuit.

248. SKIN EFFECT OF VARYING CURRENTS.—The non-uniform current density through the cross-section of the conductor. It is greatest at the surface and least at the centre.

249. SOFT VALVE.—A two or three-electrode valve containing an appreciable amount of gas.

250. SPACE CHARGE.—The electric charge possessed by the electrons or positive ions situated in the vacuous space between the electrodes of a discharge tube or thermionic valve.

251. SPARK.—An electrical discharge across a gap. It may consist of one discharge in either direction, but generally consists of a number of rapid oscillatory discharges.

252. SPECIFIC INDUCTIVE CAPACITY.—See Dielectric Constant.

253. STATIC.—Disturbances caused by atmospheric charging of the antenna.

NOTE.—When it is definitely known that disturbances are due to atmospheric charging of the antenna, the word "Static" is used. In general, disturbances are called "Strays."

254. STRAYS.—Electromagnetic disturbances set up by distant charges.

255. SYNTONY AND SYNTONISATION.—The adjustment of one circuit to another, or of one transmitter taken as a whole to one receiver taken as a whole, in such a way that their time-periods are the same and waves of a different time-period produce little or no effect on the system.

256. TELEGRAPHY, RADIO.—The art of sending and receiving radiograms.

257. TELEPHONY, RADIO.—The art of sending and receiving radiophones.

258. THERMIONIC CURRENT.—The current passing through a vacuous space and consisting of electrons or ions emitted by an incandescent electrode.

259. THERMIONIC VALVE.—A vacuum tube with incandescent filament and auxiliary electrodes which may function as an amplifier, detector or generator of electrical oscillations.

260. TICKER, TIKKER.—A rapid make-and-break device used in conjunction with a resonant circuit and a pair of telephones as a receiver for continuous waves. It discharges the condenser of the resonant circuit at every make. The speed of the make-and-break device has no relation to the wave frequency.

261. TONE WHEEL.—A high-speed commutator used as a receiver for continuous waves. It is run at a speed slightly different from the synchronous speed for the wave frequency and in effect converts the high-frequency current into a current of audible frequency.

262. TRAIN OF WAVES.—The waves produced by one discharge of the primary condenser in a spark circuit.

263. TRANSFORMER.—A stationary induction apparatus for transferring energy from one circuit to another by the medium of magnetic energy.
It may or may not transform the current into another current at different potential. In present radio practice the term should be restricted to audio frequency transformers. See Frequency, Audio.

264. TRANSMISSION, DIPLEX.—See Diplex Transmission.

265. TUNER.—An apparatus made in a convenient form, which in conjunction with a detector provides all necessary circuits and adjustments for selective tuning.

266. TUNING.—The process of securing the maximum indication by adjusting the time period of a driven element. See Resonance.

267. TUNING, SHARPNESS OF.—See Sharpness of Tuning.

268. UNDAMPED WAVES.—See Continuous Waves.

269. VACUUM TUBE, THREE ELECTRODE.—As examples see Relays, Electron and Gas.

270. VACUUM TUBE, TWO ELECTRODE.—As examples see Rectifiers, Electron and Gas.

271. VALVE, FLEMING.—A detector for oscillations. It depends on the rectifying properties of the ionised space between a hot filament and a cold electrode in an exhausted vessel.

272. VALVE, THERMIONIC.—See Thermionic Valve.

273. WAVES, ELECTROMAGNETIC.—A periodic electromagnetic disturbance progressive through space.

274. WAVELENGTH.—Twice the distance (taken in the line of propagation of the wave) between two successive points of zero disturbance; or the distance between two consecutive maxima, of the same sign. The wavelength is numerically equal to the velocity of the waves divided by the frequency.

275. WAVELENGTH (OF AN ELECTROMAGNETIC WAVE).—The distance in metres between two consecutive maxima of the same sign. The wavelength is numerically equal to the velocity of the waves (3×10^{10} cms. per second) divided by their frequency.

276. WAVELENGTH, FUNDAMENTAL.—See Fundamental Wavelength.

277. WAVELENGTH, NATURAL.—In a loaded antenna (that is, with series inductance or capacity) the natural wavelength corresponds to the slowest free oscillation.

278. WAVE CHANGER.—See Changer, Wave.

279. WAVEMETER.—A radio frequency measuring instrument calibrated to read wavelengths.

280. WAVES SUSTAINED.—Waves radiated from a conductor in which an alternating current flows.

281. WAVE TRAIN.—See Train of Waves.

282. WING CIRCUIT.—See Anode Circuit.

(ii) FOREIGN EQUIVALENTS.

Inductance, aerial	Inductance d'antenne	Induttanza dell' antenna	Inductancia de antena	Antenneninduktanz
Inductance, aerial tuning	Inductance à syntoniser le circuit de l'antenne	Induttanza per la sintonizzazione dell' antenna	Inductancia de sintonización de la antena	Induktanz zum Syntonisieren der Antenne
Inductance, low frequency	Bobine d'inductance du circuit à basse fréquence	Induttanza per il circuito a bassa frequenza	Inductancia del circuito de baja frequencia	Induktanzspule niedriger Frequenz
Inductance, primary	Inductance primaire	Induttanza per circuito primario	Inductancia primaria	Primärinduktanz
Inductance, primary syntonising	Inductance primaire de syntonisation	Induttanza sintonizzatrice del circuito primario	Inductancia primaria de sintonización	Primärinduktanz zum Abstimmen
Inductance, variable primary syntonising	Inductance primaire variable de syntonisation	Induttanza sintonizzatrice del circuito primario, regolabile	Inductancia variable de sintonización del primario	Veränderliche Primärinduktance zum Abstimmen
Induction coil	Bobine d'Induction	Rocchetto d'induzione	Bobina de inducción	Rhumkorffscher Funkeninduktor
Inkwriter, Morse	Appareil Morse enregistreur	Ricevitore scrivente Morse	Aparato Morse registrador	Schreibempfänger
Insulation	Isolation	Isolamento	Aislamiento	Isolierung
Insulation resistance	Résistance d'isolament	Resistenza d'isolamento	Resistencia de aislamiento	Isolation Widerstand
Insulator, leading-in	Isolateur d'entrée	Isolatore d'entrata	Aislador de entrada	Isolator, Einfuehrungs
Insulator, flexible	Isolateur souple	Isolatore elastico	Aislador flexible	Flexibler Isolator
Insulator, receiving	Isolateur de réception	Isolatore dell' antenna di ricezione	Aislador para circuito receptor	Isolator fur den Empfangsdraht
Insulator, transmitting	Isolateur de transmission	Isolatore dell' antenna di transmissione	Aislador para circuito transmisor	Isolator fur die Senderantenne
Interrupter	Rupteur	Interruttore	Interruptor	Unterbrecher

		Interruttore di corrente	Interruptor de corriente	Stromunterbrecher
Interrupter, electrolytic	Rupteur électrolytique	Interruttore elettrolitico	Interruptor electrolítico	Wehnelt Unterbrecher
Interrupter, turbine	Turbo-rupteur à mercure	Interruttore a turbina	Interruptor de turbina	Quecksilberturbinen-unterbrecher
Jigger	Transformateur d'oscillations	Trasformatore delle correnti oscillatorie	"Jigger"	Jigger, Selbst-induktion des Erregerkreises
Jigger, balanced	Jigger compensé	Trasformatore ad alta frequenza compensato	Jigger compensador	Jigger, bilanzierter
Jigger, primary	Primaire de transformateur d'oscillation	Circuito primario del transformatore delle correnti oscillatorie	"Jigger," primario del	Primär-Jigger
Jigger, secondary	Secondaire de transformateur d'oscillation	Circuito secondario del trasformatore delle correnti oscillatorie	"Jigger," secundario del	Sekundär-Jigger
Key-sending	Manipulateur	Tasto manipolatore di trasmissione	Manipulador	Taste
Lamp, tuning—and choke	Lampe de Syntonisation avec bobine de réactance	Lampada di sintonizzazione con bobina	Lámpara de sintonización y de reactancia	Syntonisierlampe mit Impedanz
Leyden jar	Bouteille de Leyde.	Bottiglia di Leida.	Botella de Leyden	Leydener Flasche
Leyden jar, battery of	Batterie de bouteilles de Leyde	Batteria di bottiglie di Leida	Botellas de Leyden, Bateria de	Batterie Leydener Flaschen
Lightning arrester. (*See* Arrester, lightning)				
Loading coil	Self de syntonisation	Induttanza d'aereo	Inductancia adicional	Verlängerung Spule
Magnetic amplifier	Amplificateur à transformateurs	Amplificatore magnetico	Amplificador magnético	Magnetische Verstärker
Mast, portable	Mât, portatif	Albero, portatile	Mástil, portátil	Tragbarer Mast
Masts, steel sectional	Mâts d'acier à sections	Albero di acciaio diviso in sezioni	Mástil de secciones de acero	Stahlmasten in Teilen
Mast, telescopic	Mât, téléscopique	Albero telescopico	Mástil telescópico	Teleskopmast
Microphone	Microphone	Microphono	—	Microphon
Microphone apparatus	Appareil microphone	Apparecchio microfonico	Aparato microfónico	Microphon-Apparat
Micrometer, spark	Micromètre à étincelle	Micrometro per Scintilla	Micrometro de chispa	Funkenmikrometer
Motor alternator disc set	Groupe moteur alternateur avec éclateur à disque	Gruppo convertitore con scaricatore a disco	Grupo de motor, alternador con estallador de disco	Wechselstromgenerator kombiniert mit Rotierende Funkenstrecke
Multiple antenna	Antenne multiple	Antenna multipla	Antena múltiple	Mehrfache Antenne
Multiple transmission and reception	Transmission et réception multiples	Trasmissionec Ricezione multipla	Transmisión y recepción múltiple	Vielfach Ubermittlung und Empfang
Oscillations, electric.	Oscillations électriques	Oscillazioni elettriche	Oscilaciones eléctricas	Elektrische-Schwingungen
Oscillating valve	Oscillateur à lampes	—	—	Röhrensender

English.	French.	Italian.	Spanish.	German.
Oscillatory circuit	Circuit oscillant	Circuito oscillante	Circuito oscilante	Schwingungs Kreis
Overload	Surcharge	Sovraccarica	Sobrecarga	Überlast
Plant, radiotelegraphic	Installation radiotélégraphique	Impianto radiotelegrafico	Instalación radiotelegráfica	Radiotelegraphische Anlage
Plate	Plaque, Anode	Anodica	—	Anod, Platte
Plate circuit	Circuit de plaque	Circuito di piastra	Circuito de placa	Anoden Kreis
Potentiometer	Potentiomètre	Potenziometro	Potenciómetro	Potentiometer
Radiating antenna	Antenne transmettrice	Antenna irradiante	Antena radiadora	Strahlende Antenne
Radio frequency	Haute fréquence	Frequenza radiotelegrafica	Frecuencia radio	Radio frequenz
Radiogoniometer	Radiogoniomètre	Radiogoniometro	Radiogonometro	Radiogoniometer
Range	Portée	Portata	Alcance	Reichweite
Reactance	Réactance	Reattanza	Reactancia	Inductive Widerstand
Reaction coupling	Couplage des réactions	Accoppiamento di reazione	Acoplamiento de reacción	Rück Kopplung
Receiver	Appareil récepteur	Apparecchio ricevitore	Receptor	Empfänger
Receiver arrangement	Dispositif de réception	Dispositivo di ricezione	Dispositivo de recepcion	Empfangsvorrichtung
Receiver, balanced	Récepteur compensé	Rivelatore compensato	Receptor compensador	Empfanger, bilanzierter
Receiver, flexible	Récepteur souple	Ricevitore flessibile	Receptor flexible	Empfänger
Receiver, vacuum valve	Récepteur à valve d'oscillation	Ricevitore con valvola a vuoto	Receptor de válvula de vacio	Vakuum ventil Empfänger
Rectifiers	Rectificateurs	Raddrizzatori di corrente	Rectificador	Ausgleicher
Relay	Relais	Soccorritore	Relevador	Relais
Relay H.T.	Relais pour haute tension	Soccorritore ad alta tensione	Relevador A.T.	Hochspannungrelais
Relay magnets	Aimants du relais	Magneti di soccorritore	Imanes del relevador	Relais-magnete
Resistance, high	Haute résistance	Alta resistenza	Resistencia, alta	Hoher Widerstand
Resistance, low	Basse résistance	Bassa resistenza	Resistencia, baja	Niedriger Widerstand
Resistance, starting	Rhéostat de démarrage	Reostato di avviamento	Reostato de arranque	Anlasser
Resistance regulating	Rhéostat de champ	Reostato di campo.	Resistencia de regulación	Regulierwiderstand
Room, accumulator (battery)	Salle des accumulateurs	Stanza per la batteria di accumulatori	Sala de acumuladores (Bateria)	Akkumulatorenraum
Room, operating	Salle de manipulation et réception	Ufficio radiotelegrafico	Sala telegráfica	Bedienungszimmer fur die Drahtloseinstallation
Room, transmitting	Chambre des appareils de transmission	Locale di trasmissione	Sala de manipulacion	Senderraum

			Bastos	Packsattel
Screening box	Boîte de garde	Cassetta di protezione	Caja de resguardo	Schutzkasten
Series rheostat	Rhéostat en serie	Reostato in serie	Reostato en serie	Serien Widerstand
Ship station	Station de bord	Stazione navale	Estación de á bordo	Schiffstation
Short circuiting device	Dispositif de mise en court circuit	Dispositivo di messa in corto circuito	Dispositivo de corto circuito	Kurzschliesser
Shunt, highly inductive	Shunt à pouvoir inductif élevé	Shunt ad alta induzione	Shunt altamente inductivo	Shunt mit hohe Selbstinduktion
Shunt, non-inductive	Shunt, non-inductif	Circuito in derivazione non-induttivo	Shunt, no inductivo	Nebenschlusz induktionsfreier
Signals, balancing	—	Segnali equilibrati	Señales compensadores	Balanciersignale
Signals, telephone	Signaux téléphoniques	Segnali del telefono	Señales telefónicas	Telephonsignale
Span	Haubanage	Campata	Tirante.	Abspannung
Spark	Etincelle	Scintilla	Chispa	Funke
Spark coil, with hammer-break	Bobine d'induction à interrupteur à marteau	Rochetto d'induzione a martello	Bobina de chispa con interruptor de martillo	Funkeninduktor mit Hammerunterbrecher
Spark gap	Eclateur à étincelle	Oscillatore	Espacio de chispa	Funkenstrecke
Spark gap, micrometric	Eclateur à intervalle micromètique	Oscillatore micrometrico	Espacio micrometrico	Micrometer Funkenstrecke
Spark micrometer	Micromètre à étincelles	Micrometro di scintilla	Micrómetro de chispa	Funkenmikrometer
Spark gap, multiple	Eclateur en série	Oscillatore multiplo	Espacio de chispa múltiple	Unterteilte Funkenstrecke
Spark gap, quenched	Eclateur pour étincelle étouffée	Spinterometro per oscillazioni smorzate	Descargador de chispa extinguida	Gedaempfte Funkenstrecke
Spark quenched	Etincelle étouffée	Scintilla smaorzata	Chispa extinguida	Löschfunke
Sparking distance	Distance explosive	Distanza esplosiva	Distancia explosiva	Funkenstrecke
Specific inductive capacity	Capacité inductive spécifique	Capacità induttiva specifica	Capacidad inductiva específica	Dielectricitäts Konstante
Starter, automatic	Démarreur, automatique	Avviatore automatico	Reostato de arranque, automático	Selbstanlasser
Starter, combined with shunt regulator	Rhéostat de démarrage avec rhéostat de champ	Reostato di avviamento combinato con regolatore in derivazione	Reostato de arranque y regulador de campo combinados	Anlasswiderstand mit Nebenschlussregler
Starter, single-phase	Démarreur monophasé	Avviatore per corrente monofase	Reostato de arranque monofásico	Einphasenanlasser
Starter, three-phase	Démarreur tri-phasé	Avviatore per corrente trifase	Reostato de arranque trifásico	Dreiphasenanlasser
Station, aeroplane	Aéroplane (poste d')	Stazione per aeroplano	Estación para aeroplano.	Flug-zeug Station
Station, airship	Station de ballon dirigeable	Stazione per aeronave	Estación para globos dirigibles	Luftschiffstation
Station, cart type	Station du type sur voiture	Stazione del tipo su carri	Estación tipo de carros	Karren station. Fahrbar-[station
Station, cavalry	Poste de cavalerie	Stazione per cavalleria	Estación de cavaleria	Kavalleriestation
Station, high-power	Station à grande puissance	Stazione di grande potenza	Estación de gran potencia	Kraftstation
Station, knapsack	Poste dehavresac	Stazione da zaino	Estación de mochilas	Tornisterstation
Station, landing	Poste de débarquement	Stazione da sbarco	Estación de desembarco.	Landungsstation
Station, long-distance	Poste de grandes distances	Stazione ultrapotente	Estación de gran alcance.	Radiotelegraphische Grossstation
Station, portable	Station portative	Stazione portatile	Estación portátil	Tragbarestation

English.	French.	Italian.	Spanish.	German.
Station, portable military	Poste militaire transportable	Stazione militare mobile	Estación militar portátil	Tragbare Militärstation
Station, radiotelegraph	Poste radiotélégraphique	Stazione radiotelegrafica	Estación radiotelegráfica	Funkenamt
Station, small-power	Station à faible puissance	Stazione di piccola potenza	Estación de pequeña potencia	Kleinstation
Swiss commutator	Commutateur suisse	Commutatore tipo svizzero	Conmutador suizo	Schweizerische Kommutator
Switch, aerial change-over	Commutateur d'antenne	Commutatore dell'antenna	Conmutador para cambio de hilos de antena	Luftdrahtumschalter
Switch, aerial heating	Commutateur, échauffement d'antenne	Interruttore per riscaldamento dell'antenna	Conmutador de seguridad contra calentamiento de la antena	Umschalter zum heizen der Antenne
Switch, automatic	Interrupteur automatique	Interruttore automatico	Interruptor automático	Selbsttaetiger Schalte
Switch, automatic field break	Interrupteur automatique d'excitation	Interruttore automatico di eccitazione	Interruptor automático del campo	Selbsttaetiger Magnetausschalter
Switch, carbon break	Interrupteur à contacts de charbon	Interruttore a carbone	Interruptor con contactos de carbón	Kohlenschalter
Switch, change-over	Commutateur	Commutatore	Conmutador	Umschalter
Switch, change-tune	Commutateur de longeurs d'ondes	Commutatore di sintonizzazione	Conmutador de sintonización	Wellenumschalter
Switch, charging	Interrupteur de charge	Interruttore di carica	Conmutador de carga	Ladeschalter
Switch, combined fuse and	Interrupteur avec coupe circuit	Fusibile ed interruttore combinati	Interruptor con fusible	Schalter und Sicherung-kombiniert
Switch, double-bladed knife	Interrupteur bipolaire à lames	Interruttore doppio a coltello	Interruptor de cuchillo, bipolares	Doppelmesserschalter
Switch, double-pole	Interrupteur bipolaire	Interruttore bipolare	Interruptor bipolar	Zweipoliger Schalter
Switch, double pole, double throw	Commutateur bipolaire à deux directions	Interruttore bipolare a doppio effetto	Commutador bipolar de dos posiciones	Zweipoliger Umschalter
Switchboard, d.c. and a.c.	Tableau de distribution pour courant continu et alternatif	Quadro di distribuzione per corrente continua ed alternata	Cuadro de distribución de c.a. y c.c.	Schalttafel fuer Gleich und Wechselstrom
Switch, field-break	Interrupteur de l'excitation	Interruttore ad eccitazione	Interruptor del campo	Magnetausschalter
Switch, high-tension	Interrupteur pour haute tension	Interruttore per alta tensione	Interruptor de alta tensión	Hochspannungschalter
Switch, high-tension remote control	Téléinterrupteur pour haute tension	Interruttore ad alta tensione comandato a distanza	Teleinterruptor de alta tensión	Hochspannungsfernschalter
Switch, knife	Interrupteur unipolaire à lames	Interruttore a coltello	Interruptor de cuchillo	Messerschalter

[illegible]	Interrupteur à bain d'huile	Interruttore ad olio	Interruptor con baño de aceite	Oelschalter
Switch, press (toggle)	Interrupteur à pression	Interruttore a pressione	Interruptor de tornillo	Druckschalter
Switch, quick-break	Interrupteur à rupture brusque	Interruttore a scatto rapido	Interruptor de rotura brusca	Momentschalter
Switch, single-pole	Interrupteur unipolaire	Interruttore unipolare	Interruptor monopolar	Einpoligerschalter
Switch, three-phase	Interrupteur pour courant tri-phasé	Interruttore tripolare	Interruptor trifásico	Drehstromschalter
Switch, three-way	Commutateur à trois directions	Commutatore a tre vie	Conmutador de tres pasos	3 Wege Umschalter
Switch, voltmeter	Interrupteur du voltamètre	Interruttore per voltometro	Interruptor para voltímetro	Voltmeterumschalter
Switch, wave-changing	Commutateur pour changement de longeur d'onde	Commutatore d'onda	Conmutador de cambio de onda	Wellen Umschalter
Syntonisation	Syntonisation	Sintonizzazione	Sintonización	Abstimmung
Syntonised wireless telegraphy	Télégraphie sans fil syntonisée	Radiotelegrafia sintonica	Telegrafía sin hilos sintonizada	Abstimmbare Drahtlose-telegraphie
Table, operating	Table de manipulation	Tavola per il servizio radio-telegrafico	Mesa de aparatos	Radiotelegrafischer Bedienungstisch(Apparattisch)
Tapper	Frappeur	Decoherer	Decohesor de martillo	Klopfer
Telegraphy, directional wireless	Radiotélégraphie dirigée	Radiotelegrafia a sistema dirigibile	Telegrafía sin hilos dirigida	Gerichtete Drahtlose Telegraphie
Three-electrode valve	Soupape à trois electrodes	Vuoto a tre elettrodi	—	Vakuum röhre mit drei electroden
Trailing aerial	Antenne pendante (pour avion)	Coda d'aereo	Antena colgante	Freihängende Antenne
Transformer	Transformateur	Trasformatore	Transformador	Transformator
Transformer, high-frequency oscillation	Transformateur d'oscillation à haute fréquence	Trasformatore delle correnti oscillatorie ad alta frequenza	Transformador de oscilaciones de alta frecuencia	Umformer fuer Hochfrequenzschwingungen
Transformer, oscillatory	Transformateur d'oscillation	Trasformatore delle correnti oscillatorie	Transformador oscilatorio	Oscillationsumformer

Wave frequency	Fréquence des ondes	Frequenza dell'onda	Frecuencia de onda	Wellen frequenz
Wavelength	Longueur d'onde	Lunghezza d'onda	Longitud de onda	Wellenlaenge
Wavemeter	Ondemètre	Ondametro	Ondámetro	Wellenmesser
Waves, radiation of	Radiation des ondes	Irradiamento di onde	Radiación de las ondas	Ausstrahlung der Wellen

GENERAL INFORMATION AND USEFUL TABLES

INTERNATIONAL RULES FOR THE USE OF SYMBOLS REPRESENTING QUANTITIES IN MATHEMATICAL CALCULATIONS

(*a*) Instantaneous values of electrical quantities which vary with the time to be represented by small letters. In case of ambiguity they may be followed by the subscript "t."

(*b*) Virtual or constant values of electrical quantities to be represented by capital letters.

(*c*) Maximum values of periodic electrical and magnetic quantities to be represented by capital letters followed by the subscript "m."

(*d*) In cases where it is desirable to distinguish between magnetic and electric quantities, constant or variable, magnetic quantities to be represented by capital letters of either script, heavy-faced or any special type. Script letters to be only employed for magnetic quantities.

(*e*) Angles to be represented by small Greek letters.

(*f*) Dimensions and special quantities to be represented, wherever possible, by small Greek letters.

1 gallon in wine, ale, or dry measure
= 277¼ cubic inches = ·16 cubic foot
= 10 lb. of distilled water =
Cube feet × 6·2355 = gallons.
Cube ins. × ·003607 = gallons.
1 bushel = 2218.19 cube inches = 1.28 cube foot.
Cube feet = ·78 = bushels.
Cube ins. × ·00045 = bushels.

SQUARE OR SURFACE MEASURE.

144 square inches = 1 square foot.
9 square feet = 1 square yard.
30¼ square yards = 1 square rod or perch.
40 square rods = 1 rood.
4 roods = 1 acre (4,840 square yards).
640 acres = 1 square mile (3,097,600 square yards).

METRIC SYSTEM OF WEIGHTS AND MEASURES.

The Metric System is based upon the estimated length of the fourth part of a terrestrial meridian. The ten-millionth part of this arc is called a *Metre*, and is the unit of length. The cube of the tenth part of a metre was adopted as

the unit of capacity, and denominated a *Litre*. The weight of a litre of distilled water at its greatest density was called a *Kilogramme*, of which the thousandth part, or *Gramme*, was adopted as the unit of weight. The multiples of these, proceeding in decimal progression, are distinguished by the employment of the prefixes *deca*, *hecto*, *kilo*, and *myria*, and the subdivisions by *deci*, *centi*, and *milli*. The units in general use are as follows :—

MEASURES OF LENGTH (UNIT METRE).

Equal to	Metre.	Inches.	Feet.	Yards.	Miles.
Millimetre	0·001	0·039	0·003	0·001	0·000
Centimetre	0·010	0·393	0·032	0·010	0·000
Metre	1·000	39·370	3·280	1·093	0·000
Kilometre	1000·000	39370·790	3280·899	1093·633	0·621

CUBIC, OR MEASURES OF CAPACITY (UNIT LITRE).

Equal to	Cubic inches.	Cubic feet.	Pints.	Gallons.
Cubic Centimetre	0·061	0·000	0·001	0·000
Litre, or cubic decimetre ..	61·027	0·035	1·760	0·220
Cubic Metre	61027·051	35·316	1760·773	220·096

MEASURES OF WEIGHT (UNIT GRAMME).

Equal to	Grains.	Avoirdupois lb.	Cwt. = 112 lb.	Tons = 20 cwt.
Milligramme	0·015	0·000	0·000	0·0000
Gramme	15·432	0·002	0·000	0·0000
Kilogramme	15432·348	2·204	0·019	0·0009
Tonne = 1,000 kilogs.	—	2204·000	19·678	0·9839

SQUARE OR SURFACE MEASURE.

Equal to	Square feet.	Square yards.
Square Metre .. = ...	10·7643	1·196

Hectare = 10,000 sq. met. = 11,960 sq. yds. = 2·47 acres.

The Metric System of Weights and Measures, which, as plainly demonstrated in the preceding pages, is logically symmetrical, now forms the usual standard in the following countries :—

*Argentine Republic.
Austria-Hungary.
Belgium.
*Bolivia.
*Brazil.
*Chile.
*Colombia.
Denmark.
Egypt.
France.
German Empire.
†Greece.
Holland.
Italy.
*Mexico.
Norway.
*Peru.
Portugal.
†Roumania.
Servia.
*Spain.
Sweden.

* Old Spanish measures also occasionally used are :—

Onza	=	1·014 ounce avoirdupois.
Libra	=	1·014 lb. avoirdupois.
Quintal	=	101·44 lb. avoirdupois.
Arroba (of 25 libras)	=	25·36 lb. avoirdupois.
Arroba of Wine	=	6·70 Imperial gallons.
Gallon	=	0·74 Imperial gallon.
Vara	=	0·927 yard.
Square Vara	=	0.859 square yard.

† Turkish measures are also in use :—

Oke of 410 drams	=	2·8283 lb. avoirdupois.
Almud	=	1·151 Imperial gallons.
Kileh	=	0·9120 Imperial gallon.
44 okes = 1 Cantar	=	124·3616 lb. avoirdupois.
39·6263 okes	=	1 cwt.
180 okes = 1 Tcheke	=	509·095 pounds.
1 kileh = 20 okes	=	0·36 Imperial quarter.
816 kilehs	=	100 Imperial quarters.

The following countries have not adopted the Metric System :—

CANADA.—The legal Weight and Measures are the Imperial Yard, Imperial pound avoirdupois, Imperial gallon, and the Imperial bushel. By Act 42 Vict., cap. 16, the British hundredweight of 112 pounds and the ton of 2,240 pounds were abolished, and the hundredweight was declared to be 100 pounds, and the ton 2,000 pounds avoirdupois as in United States, but sometimes contracts stipulate for the British weights.

CHINA.—

Weights— 10 Ch'ien = 1 Liang (Tael) = 1·333 oz. avoirdupois or 37·78 grammes

16 Liang = 1 Kin (Catty) = 1·333 lb. avoirdupois or 604·53 grammes

100 Chin = 1 Tan (Picul) = 133·333 lb. avoirdupois or 60·453 kilogrammes

4 ozs. = 3 taels; 1 lb. = ¾ catty or 12 taels; 1 cwt. = 84 catties; 1 ton = 16 piculs 80 catties

Capacity—10 Ko .. .. = 1 Sheng (pint) = 1·031 litre

10 Sheng .. = 1 Tou (peck) = 10·31 litre (holding from 6½ to 10 Kin of rice and measuring from 1·13 to 1·63 gallon)

Commodities, even liquids, such as oil, spirits, etc., are commonly bought and sold by weight.

Length—10 Fen .. .. = 1 Ts'un (inch)

10 T'sun .. = 1 Chi'h (foot) = 14·1 English inches by treaty

10 Chi'h.. .. = 1 Chang = 11 ft. 9 in. (141 in. by treaty)

1 Li .. .. = ⅓ English mile (about)

The mow, the unit of measurement, is almost exactly one-sixth of an acre.

In the tariff settled by treaty between Great Britain and China, the Chi'h of $14\frac{1}{10}$ English inches has been adopted as the legal standard. The standards of weight and length vary all over the Empire, the Chi'h ranging from 9 to 16 English inches, and the Chang (= 10 Chi'h) in proportion; at the treaty ports, the use of foreign treaty standard of Chi'h and Chang is common.

In October, 1907, a decree for uniform weights and measures was issued, making the K'up'ing or Treasury Scale the standard weight. The K'up'ing tael or ounce weighs 575·64 grains. The Haikwan tael weighs 581·47 grains.

INDIA.—The Maund of Bengal.

40 Seers .. .. .. = $82\frac{2}{7}$ lb. avoirdupois

The Maund of Madras .. = 25 lb. avoirdupois (nearly)

The Tola .. .. .. = 180 grains troy

The Guz of Bengal .. = 36 inches

An Act to provide for the adoption of an uniform system of weights and measures was passed in 1871. The Act orders: "Art. 2. The primary standard of weight shall be called a seer, and shall be a weight of metal in the possession of the Government of India, equal, when weighed in a vacuum, to the weight known in France as the kilogramme = 2·205 lb. avoirdupois." "Art. 3. The units of weight and measures of capacity shall be, for weights, the said

seer; for measures of capacity, a measure containing one such seer of water at its maximum density, weighed in a vacuum. Unless it be otherwise ordered, the subdivisions of all such weights and measures of capacity shall be expressed in decimal parts." This Act, however, has never been in operation.

JAPAN.—

The Mommé	= 2·11 drams or 2·41 dwts. or 120 mommé = 1 lb. avoirdupois
The Kin (Catty) = 160 mommé	= 1·322 lb. avoirdupois (0·266 mommé = 1 gramme) or 1·60 lb. troy
The Picul (100 kin)	= 132·27 lb.
The Kwan = 1,000 mommé ..	= 8·261 lb. avoirdupois or 10·04 lb. troy
The Shaku	= ·994 foot (3·3 shaku = 1 metre)
The Kujira Shaku	= 1·242 feet
The Sün	= 1·193 inches
The Ken = 6 Shaku	= 5·965 feet
The Jo = 10 Shaku	= 9·942 feet
The Chô = 60 Ken	= 357·916 feet, or about $\frac{1}{15}$ mile
The Ri = 36 Chô	= 2·44 miles
The Ri (marine)	= 1·15 mile
The Ri (square)	= 5·9552 square miles
The Chô = 10 tan	= 2·45 acres
The Koku, Liquid = 10 To = 100 Sho	= 39·7033 gallons
The Koku, Dry	= 4·9629 bushels
The Koku (capacity of vessel)	= $\frac{1}{10}$ ton
The To, Liquid	= 3·9703 gallons
The To, Dry	= 1·9851 peck

RUSSIA.—

1 Verst (500 sajènes)	= 3,500 feet, or two-thirds of a statute mile
1 Sajène (3 arshins)	= 7 feet
1 Arshin (16 vershok) ..	= 28 inches
1 Square Verst	= 0·43941 square mile
1 Dessiatine	= 2·69972 acres
1 Pound (96 zolotniks = 32 lot)	= $\frac{9}{10}$ of a pound or 14·4 ounces
1 Pood (40 pounds)	= 36·113 lb. = 0·32244 cwt. or 100 poods = 1·6121 tons. Baltic Freight is usually quoted per ton of 62 poods
1 Vedro (8 shtoffs)	= 2¾ Imperial gallons
1 Chetvert (8 chetveriks) ..	= 5·77 Imperial bushels or 46·2 gals.

UNITED STATES.—

British weights and measures are usually employed, but the old Winchester gallon and bushel are used instead of the new or Imperial standards. Different States have a legal standard for bushels of certain articles, such as grain and potatoes, varying from 60 lb. for wheat to 32 for oats.

Wine gallon	=0·83333 gallon
Ale gallon	=1·01695 gallon
Bushel	=0·9692 Imperial bushel

Instead of the British cwt. a central of 100 lb. is used. 1 ton = 2,000 lb., except coal, which is usually 2,240 lb. wholesale.

NAUTICAL MEASURES

(*From " Lloyd's Calendar," by permission of the Committee of Lloyd's.*)

12 inches	= 1 foot	6 feet	= 1 fathom
3 feet	= 1 yard	3 nautical miles ..	= 1 league

Sea or Nautical Mile = one-sixtieth of a degree of latitude, and varies from 6,046 ft. on the Equator to 6,092 ft. in lat. 60°

Nautical Mile for speed trials, generally called the Admiralty Measured Mile { 6,080 feet; 1.151 statute miles; 1,853 metres

Cable's length = the tenth of a nautical mile; or, approximately, 100 fathoms or 200 yards.

A Knot = a nautical mile an hour, is a measure of speed, but is not infrequently, though erroneously, used as synonymous with a nautical mile.

Length of European Measures of Distances compared with the Nautical Mile of 6,080 *ft.*

	Length in Nautical Miles.		Length in Nautical Miles.

DISTANCE OF HORIZON AT SEA.

Let h be the height of the observer's eye above sea level, D the distance to the horizon, and R the earth's radius.

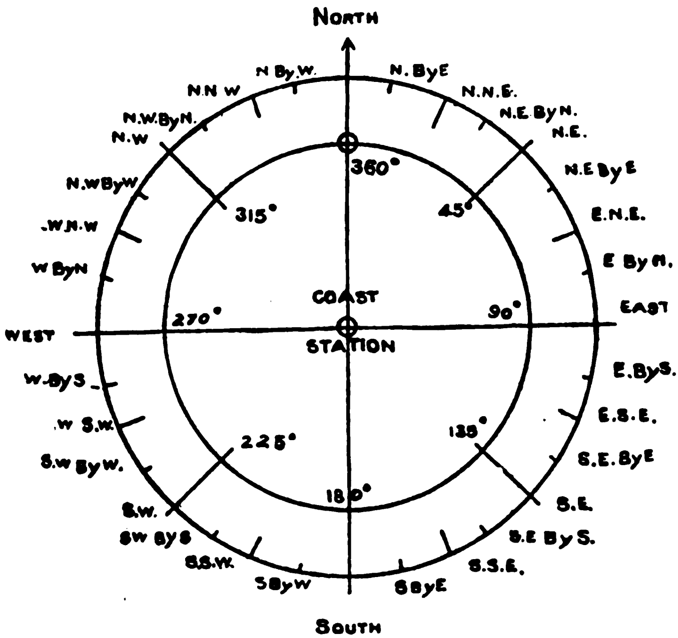
Then

$$D^2 = 2Rh$$

And thus D in statute miles $= 1{\cdot}22\ \sqrt{h}$ in feet

D in kilometres $= 2{\cdot}52\ \sqrt{h}$ in metres

An object of height h^1 is seen by an eye at height h at a distance D^1 given by



D^1 in statute miles $= 1{\cdot}22\ \sqrt{h}$ in feet $+ \sqrt{h^1}$ in feet

D^1 in kilometres $= 2{\cdot}52\ \sqrt{h}$ in metres $+ \sqrt{h^1}$ in metres

The distance of the horizon—*i.e.*, the greatest distance at which the surface of the sea is visible—varies somewhat with refraction in the atmosphere.

METHOD OF DENOTING THE TRUE BEARING AND COURSE OF A SHIP AT SEA

As regards the true bearing *of* the ship *from* the coast station, the degrees are reckoned " clockwise " from north round through east, south and west.

Thus, if the ship's *bearing* from the coast station is anything between north and east, the number to be signalled will be between 0 and 90.

Between east and south the number will be between 90 and 180.

Between south and west the number will be between 180 and 270.

Between west and north the number will be between 270 and 360.

Similarly, if the ship's *course* is between N. and E. the number to be signalled will be between 0 and 90.

Between E. and S. the number to be signalled will be between 90 and 180.

Between S. and W. the number to be signalled will be between 180 and 270.

Between W. and N. the number to be signalled will be between 270 and 360.

To facilitate the conversion of the bearing and course into the number of degrees to be signalled, a table is appended in which either the bearing of the ship from the coast station, or the bearing of the coast station from the ship can be ascertained and the number of degrees to be signalled seen at a glance. The course must be looked for in the same column as the bearing *of* the ship *from* the coast station.

Thus a ship 150 miles bearing S 75° W. from a coast station and steaming S. 85° E. at 15 knots, and having telegrams comprising 75 words to send, on receiving the signal to Go (— • —) from the coast station, would signal the following :—

— • — • — XYZ — • • • • ABC 150 255

95 15 75 • — • — •

(end).

MEASURES OF TIME

The earth's axial rotation is the phenomenon by which time is measured everywhere on the earth's surface. Experiment and observation show that if we assume the earth to rotate uniformly, there are many other phenomena which are as accurately isochronous in their periodicity. That is to say, they pass again and again through all their phases in exactly the same interval of time as measured in terms of the earth's rotation. In the pendulum of a clock and the balance wheel of a watch we have such isochronism very approximately realised. A little consideration will convince us that the measurement of time is really a comparison of periodic sequences. We cannot conceive any other mode of marking off time intervals than by some kind of motion of a periodic character. Our practical unit of time is essentially terrestrial.

Sidereal Day.—The standard unit of time is the Sidereal Day, being the period in which the earth turns once round on its axis. It is divided into sidereal hours, minutes, and seconds; but these measures of time are used by astronomers only.

Mean Solar Time.—A Second is the time of one swing of a pendulum adjusted so as to make 86,164·09 swings in a sidereal day. Seconds are usually subdivided decimally.

One Mean solar day = 24 hours = 1,440 minutes = 86,400 seconds = 1·00273791 sidereal day.

Relation between Time and Longitude.—At any given instant the mean solar time at two stations differ by an amount proportional to their difference of longitude, the time at the eastern station being the earlier.

Corresponding Differences.

Longitude.	Time.	Longitude.	Time.
15″	1 second.	75°	5 hours.
1′	4 seconds.	90	6 ,,
15′	1 minute.	105	7 ,,
1°	4 minutes.	120	8 ,,
15°	1 hour.	135	9 ,,
30	2 hours.	150	10 ,,
45	3 ,,	165	11 ,,
60	4 ,,	180	12 ,,

To show the exact date of any event, the meridian at which the time is reckoned must be specified. One degree longitude at Equator = 60 nauts = 69·17 statute miles.

FOREIGN AND COLONIAL MONEYS WITH APPROXIMATE VALUE IN BRITISH CURRENCY AT *NORMAL* RATES OF EXCHANGE

Argentine Republic.—Gold coin, 5 dollars. Silver coins, 1 dollar and 50, 20, and 10 centavos. Bronze coins, 2 and 1 centavos. Nickel coins, 20, 10 and 5 centavos. Silver dollar or peso = 4s. Money in circulation is chiefly paper, being converted at 44 cents gold to dollar = 1s. 9d. Gold dollar = 4s.

Australia.—The same as in Great Britain.

Austria-Hungary.—Gold coins, 100 krone = £4 3s. 4d.; 20 krone = 16s. 8d.; 10 krone = 8s. 4d.; Single ducat = 11 crowns 29 heller = 9s. 4¾d. Silver coin, 1 krone = 100 heller = half gulden old coinage = 10d. Exchange

about 24 krone to £. Silver gulden or florins (about 12=£)=100 kreutzer continue to be legal tender. Nickel, 20 heller=10 kreutzer of old coinage=2d., 10 heller=5 kreutzer of old coinage=1d. Bronze, 2 heller=1 kreutzer=½d., 1 heller=½ kreutzer=$\frac{1}{10}$d.

Belgium.—The same as France.

Bolivia.—100 centavos=1 boliviano (paper)=about 1s. 7d., or 12½ bolivianos to £. Coins in circulation are—silver, 50, 30, 20 and 10 centavos; nickel, 10 and 5 centavos, and English gold coin. Currency principally paper.

Brazil.—Currency paper, worth 1s. 4½d. per milreis (1,000 reis) or nearly 15 milrei=£1. Silver coinage of 2, 1 and ½ milreis pieces in circulation.

British Honduras.—100 centavos=1 dollar (gold)=4s. 1½d. British soverign (=$4.86) and half sovereign, and U.S. gold coins legal. Silver coins—5, 10, 25 and 50 cents legal tender to $10. Bronze—1 cent. legal tender to 50 cents.

Bulgaria.—Lev (=franc) = 100 stotinki=9½d. (stotinka=centime). Gold coins, 10 and 20 leva, but foreign 10 and 20 franc pieces principally in circulation. Silver, ½, 1, 2 and 5 leva. Nickel, 2½, 5, 10, 20 stotinki. Bronze, 1, 2, 5, 10 stotinki.

Canada.—1 cent=½d. 100 cents=1 dollar=about 4s. 1½d. 4 dollars 86⅔ cents=£ sterling. U.S. gold coins also legal.

Chili.—Gold coins, 20 (colon or condor), 10 (doubloon), and 5 (escudo) peso pieces. Silver coins, 1 peso and ½, $\frac{1}{10}$, and ¼ of a peso. Bronze coins, ½, 1, 2 and 2½ centavo pieces. Currency is paper—the peso or dollar=about 10d. The restoration of the gold currency is projected under a currency law which was to take effect in 1910, but has been since deferred. Gold peso=1s. 6d. English sovereign has a legal value of 13⅓ pesos gold.

China.—1,220 (about) cash=1 haikwan (or customs) tael=about 2s. 8½d. About 35 cash=1d. A coin recently issued is the "hundredth of a dollar" worth about $\frac{3}{5}$ of 1d. Silver dollar of same value as Japanese silver yen, is also current. At Hong-Kong the dollar (1,000 cash)= about 1s. 11d. and at Shanghai about 2s. 8d. In October, 1908, an Imperial Edict decreed the establishment of a uniform Tael currency—unit silver tael to have a value of between 30d. and 40d.

Cochin China.—5 sapèques or cash=1 cent; 100 cents=1 dollar=about 2s.

Colombia.—100 centavos=1 peso or dollar gold—nominal value 4s. Gold coins, 1, 2½ and 5 dollars. Silver coins, real peseta, half-dollar and dollar. Very few coins are in circulation, the currency being principally paper, subject to considerable fluctuation. At the legal rate the paper peso=1 centavo gold, or $500=£1.

Denmark.—100 Oere=1 Krone=1s. 1½d. 18 Kroner 19 Oere=£ sterling. Gold coins of 20 Kroner and 10 Kroner. Silver, 2 Kroner, 1 Krone, 25 Oere, and 10 Oere.

Egypt.—97½ piastres=£ sterling. 100 piastres, or 1,000 milliemes=£ Egyptian (gold)=£1 0s. 6½d. Gold circulating is almost exclusively English. 10 milliemes=1 piastre=about 2½d. Gold piece of 20 francs =about 77 piastres. Silver coins, 1, 2, 5, 10 and 20 piastres; legal tender to £E2.

Eritrea.—1 tallero=5 Italian lire. Silver coins, 1, 2, 5 talleros.

FRANCE.—100 centimes = 1 franc = 9½d. 20 franc piece (Louis or Napoleon) = 15s. 10d. About 25 francs 25 centimes = £ sterling. Gold coins of 5, 10, 20, 50 and 100 francs. Silver coins 20 centimes, ½, 1, 2 and 5 franc pieces. Nickel coin, 25 centimes. Bronze coins, 1, 2, 5 and 10 centimes.

GERMANY.—100 pfennig = 1 mark = about 1s. About 20·45 m. = £ sterling. Gold coins, 20 (doppel-krone), 10 (krone), and 5 (half-krone) marks. Silver coins, 1, 2, 3 and 5 marks and 50 pfennige. Thaler = 3 marks = 2s. 11d. Nickel coins, 20, 10 and 5 pfennige. Bronze coins, 1 and 2 pfennige.

GREECE.—100 lepta = 1 drachma paper = 9d. 27 drachmæ 30 lepta = £1 or about 108 drachmæ per 100 fcs. Foreign gold coins in circulation.

HOLLAND.—100 cents = 1 guilder or florin = 1s. 8d. 12 guilders 10 cents = £ sterling. Gold coins, 10 florins (16s.). Silver coins, 2½ guilders (rijksdaaler), 1 guilder, ½ guilder and 25 cents.

INDIA.—£1 = 15 rupees. 16 annas = 1 rupee = 1s. 4d. 3 pie = 1 pice, 12 pie = 1 anna = 1d. Lac of rupees = 100,000. Crore of rupees = 10,000,000.

ITALIAN SOMALILAND.—Rupia, value L. It. 1.68 (= £1/15 ster.). Silver coins, 1 rupia, ½ rupia, ¼ rupia. Bronze coins, 1 besa (value L. It. 0·0168) 2 besas, 4 besas. 1 rupia is equal to 100 besas.

ITALY.—100 centesimi = 1 lira = 9½d. About 25 lire 40 centesimi = £1 sterling. Gold coins, 100, 50, 20 and 10 lire. Silver coins, 5, 2, and 1 lira. Nickel coin, 20 centesimi. Bronze coins, 1, 2, 5 and 10 centesimi.

JAPAN.—10 rin = 1 sen = ¼d., 100 sen = 1 yen or dollar = 2s. 0½d. Gold coins 5, 10 and 20 yen. Silver coins, 10, 20 and 50 sen. Nickel coin, 5 sen. Bronze coins, 1 sen and 5 rin. The unit of account is the gold yen.

LIBYA.—The same currency as in Italy.

MEXICO.—100 centavos = 1 dollar or peso (silver) = 2s. 0½d.

NORWAY.—100 ore = 1 krone = 1s. 1½d. Gold coins, 10 and 20 kroner. Exchange 18·19 kroner = £ sterling. Paper money principally used; least value, 5 kroner. Below this amount, silver and copper coins.

PORTUGAL.—100 reis = 1 teston = 4d. 1,000 reis = 1 milreis. Paper milreis = about 4s. 1d. Gold coins, 1, 2, 5 and 10 milreis. Currency, principally paper. Conto = 1,000 milreis. In the Azores, 1 milrei = 3s. 6½d.

ROUMANIA.—1 leu = 100 bani = about 9½d. Gold coins, 5, 10 and 20 lei. Silver, 1 leu, 2 and 5 lei. Nickel, 5, 10 and 20 bani.

RUSSIA.—100 copecks = 1 rouble. Silver or paper rouble = 2s. 1½d. Gold coins—15 roubles (imperial), 10 roubles, 7·50 roubles (half-imperial), 5 roubles. 15 paper roubles = 10 roubles gold = roughly 1 guinea. Currency principally paper.

SERVIA.—Dinar = 1 franc = 9½d. Gold coins, 10 and 20 dinars. Silver, ½, 1, 2, 5 dinars. Bronze, 5 and 10 paras. Nickel, 5, 10, 20 paras.

SPAIN.—100 centimos = 1 peseta—about 26·70 pesetas to the £ sterling. Gold coins are 20, 10 and 5 peseta pieces. Silver coins, 1 and 5 pesetas.

STRAITS SETTLEMENT AND MALAY STATES.—Gold dollar = 2s. 4d. Silver coins—50, 20, 10, and 5 cent pieces—are legal tender to 2 dollars, but ½ dollar is unlimited tender. Copper coins—1, ½ and ¼ cents—are legal tender to 1 dollar.

SWEDEN.—Krona of 100 ore = 1s. 1¼d. or 18·19 kr. to the £1. Gold little used. Currency for 5 kr. or more mostly paper.

TURKEY.—40 paras = 1 piastre = 2¼d. nearly. 20 piastres = 1 medjidie. 100 piastres = 1 lira turca or gold medjidie = 18s. 109½ pias = £1. "Purse," sometimes used in accounts = 500 piastres or 5 liras and is calculated = £4 10s. 0d. Value of piastre varies in different parts of the Turkish Dominions. In Syria 1 Turkish £ = 130 local piastres and £1 = 143½ local piastres.

UNITED STATES.—1 cent = about ½d., 100 cents = 1 dollar = 4s. 1½d. 4 dols. 87 cents = £ sterling. Gold coins, 2½ dollar piece, half eagle (5 dollars), 1 eagle (10 dollars), 1 double eagle (20 dollars).

URUGUAY.—100 centavos = 1 dollar (gold) = about 4s. 3d., or $4·70 = £. Only foreign gold coins (which are legal tender) are in circulation. Silver coins, 10, 20 and 50 cents and 1 dollar. Nickel, 1, 2 and 5 cents.

VENEZUELA.—Medio = about 2½d.; real = about 5d. Monetary unit is silver bolivar = about 9½d., or 1 franc, or 25·25 bols. to the £. Exchange fluctuates slightly from the par, but 25·25 bols to the £ should be taken as a basis. Currency is based on gold standard—no paper in circulation. Coins are gold, silver and nickel, but principal coin is silver dollar of 5 bols. known as "peso fuerte" or simply "fuerte."

ATOMIC AND ELECTRONIC DATA

The radius of a hydrogen molecule is $1·2 \times 10^{-8}$ cms.

The mass of a hydrogen molecule is $3·3 \times 10^{-24}$ gms.

The average velocity of a molecule in air at 15° C. is 459 metres per second.

The mean free path of a molecule in air at atmospheric pressure is $1·42 \times 10^{-5}$ cms.; in a soft valve of typical pressure ·5 mm. the mean free path is $2·16 \times 10^{-2}$ cms.; while in a hard valve of pressure 10^{-6} mm. the mean free path is 12,500 cms.

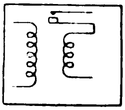
The number of molecules per cc. at atmospheric pressure is $2·75 \times 10^{19}$; thus their average distance apart is 3×10^{-6} cms.

The number of molecules per cc. in a soft valve of pressure ·5 mm. is $1·8 \times 10^{16}$; thus their average distance apart is $3·8 \times 10^{-6}$ cms.

The number of molecules per cc. in a hard valve of pressure 10^{-6} mm. is $3·6 \times 10^{10}$; thus their average distance apart is 3×10^{-4} cms.

The negative charge on an electron is $4·774$ electrostatic units or $15·91 \times 10^{-20}$ coulombs.

The diameter of an electron is 4×10^{-13} cms.



The mass of an electron is 9×10^{-28} gms.

The velocity of an electron after falling through a potential drop of *V* volts is $6 \times 10^7 \sqrt{V}$ cms. per second; thus after falling through a potential of 100 volts the electronic velocity is $6 \times 10^7 \times \sqrt{100} = 6 \times 10^8$ cms. per second.

GRAPHICAL SYMBOLS FOR RADIO DIAGRAMS.

THE need for a uniform system of conventional signs for the simple interpretation of circuit diagrams used in the graphical explanation of radio apparatus has resulted in the inclusion in the report of the Committee of the British Engineering Standards Associanion, a section devoted to Radio-Communication.

Below is reproduced Section 8, *Radio-Communication of the *British Standard Graphical Symbols for Electrical Purposes.*

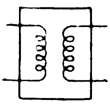
801. Spark Coil.

841. Coherer Detector.

842. Magnetic Detector.

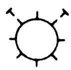
848. Incandescent[4] Lamp (Radio Symbol).

802. Arc Generator.



843. Crystal Detector.

851. Spark Gap (General Symbol).



803.* Aerial (Antenna).

844. Rectifier without filament.

852. Quenching Spark Gap.[5]

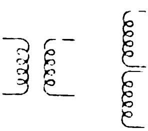
804. Air Core Transformer.[1]

845. Thermionic Valve 2 Electrodes.

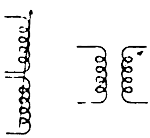
853. Rotary Spark Gap.

805. Variable Inductance (Variometer).[2]

846. Thermionic Valve 3 Electrodes.



861. Direct Coupling



806. Decremeter.[3]

862. Inductive Coupling.

847. Thermionic Valve 4 Electrodes.

831. Telephone Receiver.

863. Fixed Air Core Mutual Inductance.[6]

864. Variable Air Core Mutual Inductance.[6] [7]

[1] If necessary, show different number of turns.
[2] When an arrow is shown, the variation is caused by change of the relative position of the coils.
[3] The circle generally has δ written inside it.
[4] The general symbol for an Incandescent Lamp is shown thus —O— (symbol 582, section 5).
[5] The figure indicates the number of gaps.
[6] Either of the two methods shown.
[7] When the angle between the axes of the two coils is zero, the mutual inductance is a maximum.
* The symbols in Section 8, dealing with Radio-communication, were prepared by a joint Committee of the Post Office, Admiralty, War Office, Royal Air Force and Marconi's Wireless Telegraph and Telephone Company, Ltd.

COMPANIES ENGAGED IN THE COMMERCIAL DEVELOPMENT OF RADIOTELEGRAPHY AND RADIOTELEPHONY

PARTICULARS OF COMPANIES ENGAGED IN THE COMMERCIAL DEVELOPMENT OF WIRELESS TELEGRAPHY & TELEPHONY

Amalgamated Wireless (Australasia), Ltd.

Incorporated.—July 11th, 1913, in the State of New South Wales.

Head Office.—"Wireless House," 97, Clarence Street, Sydney, New South Wales.

Melbourne Office.—422/4, Chancery Lane, Melbourne, Victoria.

New Zealand Office.—"Australasia Chambers," Customs House Quay, Wellington, New Zealand.

Directors.—Hon. Sir Thomas Hughes, M.L.C. (Chairman), C. P. Bartholomew, Ernest T Fisk, Alfred Gonman, James Taylor, F.C.P.A., Capt. T. Langley Webb.

Managing Director.—Ernest T. Fisk.

Assistant Manager and Secretary.—J. F. Wilson.

Accountant.—F. W. Larkins, A.I.I.A., A.C.I.S.

Factory Manager.—S. M. Grime.

Sales Manager.—V. Gardiner.

Technical Department :—Superintendent (Acting).—W. Bostock.

Marine Department :—Traffic Manager.—J. L. Mulholland. **Equipment Manager.**—D. Campbell.

Marconi School :—Manager.—A. R. Mancer.

Melbourne Branch :—Manager.—L. A. Hooke.

New Zealand Branch :—Manager.—G. Robertson.

Capital.—Authorised £200,000. Issued £160,000 in 160,000 shares of £1 each, all fully paid up. Financial year of the Company ends at June 30th. The annual general meeting is held in August.

The Company owns the sole and perpetual license to use and exploit all Marconi Patents, also all Patents for the Poulsen Pedersen and Quenched Singing Spark Systems in the Commonwealth of Australia, in the Dominion of New Zealand, and in parts of the Pacific and Indian Oceans.

It has a large organisation for manufacturing wireless telegraph apparatus, erection and operation of stations, and the system is installed on over 200 passenger and cargo ships.

The Company also controls The Wireless Press, Sydney, booksellers and publishers of "Sea, Land and Air," and the Australectric Company, Sydney, manufacturers and suppliers of Amateur Wireless and all descriptions of electrical apparatus, which Company holds a number of important and exclusive agencies.

Accounts.—The accounts are made up to June 30th in each year. The profit and loss account for the twelve months ended June 30th, 1920, shows that the gross profit from trading account, radiotelegraphic traffic, ships' subsidies, etc., amounted to £47,032 19s. 4d., and after deducting all expenses (including depreciation amounting to £5,389 2s. 5d.) there was a net profit of £8,847 10s. 5d., from which a dividend at the rate of 5 per cent. per annum was paid.

Reserve accounts at June 30th, 1920, stood at £36,314 0s. 8d. Dividends, 1913–14, 4 per cent., 1914–15, 6 per cent.; 1915–16, 5 per cent.; 1916–17, 5 per cent.; 1917–18, 5 per cent.; 1918–19, 5 per cent.; 1919–20, 5 per cent.

American Radio and Research Corporation

Incorporated.—June 15th, 1915.

Head Office.—Medford Hillside, Massachusetts.

District Offices.—21, Park Row, New York City, New York, U.S.A. 608, So. Dearborn Street, Chicago, Ill., U.S.A.

Directors.—J. Axten, Havens Grant, and H. J. Power.

Vice-President and General Manager.—Harold J. Power.

Secretary.—Havens Grant.

Capital.—$300,000.

Dividends.—Close corporation.

The Company designs and manufactures fractional horse-power motors and accessories, wireless telegraph and telephone apparatus.

Australectric Company (The)

Formed.—August, 1918.

Head Office.—97, Clarence Street, Sydney, New South Wales.

Works.—242, Kent Street, Sydney, New South Wales.

Branch Offices.—422/4, Chancery Lane, Melbourne, Victoria; "Australasia Chambers," Wellington, New Zealand.

Officers.—General Manager, Ernest T. Fisk. Assistant Manager, J. F. Wilson. Sales Manager, V. Gardiner.

The Company is owned and controlled by Amalgamated Wireless (Australasia), Ltd. It was formed for the purpose of exploiting amateur wireless apparatus manufactured by the parent concern. The operations of the Company now embrace the manufacture and sale of general electrical apparatus and accessories.

Some valuable and exclusive agencies are held by the Company, including Relay Automatic Telephones, Diamond Dry Cells, and Ozonair.

Chinese National Wireless Telegraph Company (The)

Incorporated.—Under Special Charter by virtue of an agreement dated May 24th, 1919, between the Government of the Republic of China and Marconi's Wireless Telegraph Company, Ltd.

Office.—5, Peh Ch'a Ta Fu Ssu, Peking.

Directors.—Lieut.-Gen. Ting Ching (Chairman), Rear-Admiral Chen Ngen Tao, Lin Chih Hsiu, Godfrey C. Isaacs, T. A. Barson, A. H. Ginman (Vice-Chairman and Managing Director).

Secretary.—Sohstu G. King.

Capital.—Authorised £700,000 in 700,000 shares of £1 each.

The Company was formed to manufacture, sell and maintain wireless telegraph and telephone apparatus in China, and has been granted a license by Marconi's Wireless Telegraph Company, Ltd., giving it the sole right to use in China all the Marconi Company's Patents, present and future, for wireless telegraphy and telephony.

Compagnie Radio-Maritime

Incorporated.—April 24th, 1919.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—MM. Bousquet (President), Baron de la Chevrelière (Vice-President), N. Pietri, E. Girardeau, E. Sins, Dal Piaz, Musnier, and Max Robert.

Managing Director.—M. N. Pietri.

Capital.—5,000,000 francs, divided into 50,000 shares of 100 francs each.

The Company owns and operates wireless telegraph apparatus on merchant vessels.
The Company also operates aeroplane wireless stations.

Compagnie Générale de Télégraphie Sans Fil

Incorporated.—February 5th, 1918.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—H. Bousquet (President), Baron de la Chevrelière (Vice-President), A. L. Atthalin, M. Bloch, A. Dupont, E. Girardeau, Godfrey C. Isaacs, E. May, N. Pietri, E. Sins, Paul Gauthier, L. Wibratte, Baron Jacques de Gunzburg.

Managing Director.—E. Girardeau.

Chief Engineers.—Major Brenot, Major Garnier.

Capital.—50,000,000 francs, divided into 100,000 shares of 500 francs each, subscribed and fully paid; 32,000 Parts Bénéficiaires have also been issued.
The financial year ends December 31st.

Companhia Radiotelegraphica Brasileira

Incorporated.—August 14th, 1919.

Head Office.—107, Rua 1° de Marco, Rio de Janeiro.

Directors.—Pedro A. Nolasco Pereira da Cunha, Louis Edgar Sanceau, Dr. Mario de Andrade Ramos, Señor Henrique Lage, Señor Joao Gentil de Mello Araujo, Jack Maurice, Dr. Rodrigo Octavio Filho, and Señor Roberto Cardoso.

President.—Pedro A. Nolasco Pereira da Cunha.

Managing Director.—Louis Edgar Sanceau.

Members of the Fiscal Council.—Dr. Mario de Andrade Ramos, Señor Henrique Lage, Señor Joao Gentil de Mello Araujo.

Members of the Supplementary Council.—Jack Maurice, Dr. Rodrigo Octavio Filho, Señor Roberto Cardoso.

Capital.—Rs.200:000 $000 (two hundred contos de reis) divided into 2,000 (two thousand) shares of 100$000 (hundred milreis) each.

The objects of the Company are to exploit the various patents of the Marconi Company and obtain from the Government of Brazil the necessary permission to erect high-power stations for direct communication with Europe and the United States.

Compañia Marconi de Telegrafia Sin Hilos del Rio de La Plata

Incorporated.—August 4th, 1906.

Head Office.—Calle Lavalle 544, Buenos Aires, Argentina.

Directors.—Captain Guillermo José Nunes (President), Señor Florence O'Driscoll (Managing Director), Colonel Sir Thomas Holdich, K.C.M.G., K.C.I.E., C.B., Godfrey C. Isaacs, Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., Señor Duncan Munro, Señor J. A. Pilling, Señor Carlos Fereira Pinto, Señor Enrique Schlieper, Sidney F. St. J. Steadman, Señor Antonio Terrarosa.

Secretary.—Enrique Schlieper.

Treasurer.—J. A. Pilling.

Auditor.—Herbert K. James.

Engineer.—E. Berry.

Capital.—$2,000,000 gold, represented by 250,000 shares of $5 gold each, series "AA," fully paid, and 150,000 Preference shares, 5 per cent. (non-cumulative) of $5 gold each, series "BB." 35 per cent. has been called up on the "BB" shares. The balance is payable in instalments of 10 per cent. with not less than thirty days' notice. The financial year of the Company ends on May 31st.

The Company owns the Marconi patents and patent rights for the Argentine Republic, and has licenses from Marconi's Wireless Telegraph Company, Limited, and the Marconi International Marine Communication Company, Limited, to work the Marconi system in the Republics of Argentina, Uruguay, and Paraguay. The Company has the permission of the Government to erect wireless telegraph stations within the territorial limits of the Argentine Republic and on vessels flying the Argentine flag. The Company is constructing a high-power wireless station in the Argentine Republic to communicate direct with a similar station in Europe.

Compañia Nacional de Telegrafia Sin Hilos

Incorporated.—December 24th, 1910.

Head Office.—Calle de Alcalá, 43, Madrid.

Branch Offices.—Ronda de la Universidad 35, Barcelona; Buenos Aires 13, Bilbao.

Directors.—Excmo. Sr. General Don José de Bascaran; Excmo. Sr. Senatore G. Marconi, G.C.V.O., LL.D., D.Sc.; Godfrey C. Isaacs; Excmo. Sr. Don Antonio Comyn, Conde Vo. de Albia; Excmo. Sr. Don José Sanchez Guerra; Excmo. Sr. Don Eduardo Estelat; Excmo. Sr. Don Francisco Setuain; Sr. Don Jaime Macnaughtan, Sr. Don José Asensio, and Sr. Don Manuel Moreno Quesada.

Secretary.—Sr. Don José Asensio.

Capital.—6,500,000 pesetas, divided into 8,000 6 per cent. Participating Preference shares of 500 pesetas each, and 5,000 Ordinary shares of 500 pesetas each, all issued and fully paid.

The financial year ends on December 31st.

This Company took over the concession from the Spanish Government for the construction and exploitation of a public wireless telegraph service in Spain and its colonies. The Company has ten wireless telegraph land stations erected and working at Aranjuez, near Madrid, Cadiz, Barcelona, Teneriffe, Las Palmas, Vigo, Soller, Finisterre, Santander, and Cape Palos, and has further stations in course of construction. The Company holds an exclusive license from Marconi's Wireless Telegraph Company, Limited, to use and exploit its patents in Spain and her colonies.

The Company has established a direct wireless telegraph service between Spain and England, and also conducts services with Germany via Barcelona and Nauen; Austria via Barcelona and Deutsch-Altenburg; Hungary via Barcelona and Budapest; France via Sainte Assise; and Italy via Barcelona and Centocelle (Rome).

Compagnie Radio-France

Head Office.—Paris, 79, Boulevard Haussmann.

Directors.—Jules Cambon (President), Henri Bousquet, Emile Girardeau, Nicolas Pietri, Louis Wibratte, Marcel Bloch, Jules Carpentier, Baron de la Chevrelière, Andre Dupont, O. Gauthier André Laurent-Atthalin, Ernest May, Henri-Valentin Mehu.

Capital.—Frs. 60,000,000.

The Company supply material and apparatus and erect wireless stations of any power for telegraphic or telephonic communication.

Drahtloser Übersee-Verkehr A.G. (Transradio)

Founded.—1918.

Head Office.—Berlin S.W.11, Hallesches-Ufer 12/13.

Founded by the Allgemeine Elektricitätsgesellschaft, Siemens & Halske A.G. and the Gesellschaft für drahtlose Telegraphie m.b.H. (Telefunken), Berlin. The Company was formed to exploit installations for wireless telegraphy and telephony in Germany and other countries.

Directors.—Frits Ulfers, Karl Solff, Otto Betz (Vice-Director).

The Company has substantial interests in the Transradio, Compania Radiotelegrafica Argentina S.A., Buenos Aires.

Federal Telegraph Company (The)

Incorporated.—In the State of California, in 1911.

Offices.—Hobart Building, San Francisco, California, and 400, Homer Building, Washington D.C.

Factory.—Palo Alto, California.

Directors.—R. P. Schwerin, Leon Bocqueras, Hiram W. Johnson, Jun., Alexander Hamilton and B. E. Alanson.

President.—R. P. Schwerin.

Vice-President.—Leon Bocqueras.

Secretary.—Augustus Taylor.

Treasurer.—J. E. Godcharles.

Capital.—\$2,500,000°°; 250,000 shares, par value each \$10°°.

The Company was formed for the operation of wireless telegraphy and the manufacture of the Poulsen Arc and other wireless sets.

Gesellschaft für Drahtlose Telegraphie m.b.H. (Telefunken)

Incorporated.—June 15th, 1903.

Head Office.—Hallesches Ufer 12/13, Berlin, S.W.11.

Directors.—Count von Arco, Dr. ing. C. Schapira, Fritz Ulfers, Karl Solff (Vice-Director).

Founded by the Allgemeine Elektritititäts-Gesellschaft, Berlin, and Siemens and Halske A.G., Berlin, for the exploitation of the patents of Professor Slaby, Professor Braun, and Count von Arco all over the world.

The Company, whose shares are in the sole possession of the Allgemeine Elektrititäts Gesellschaft and Siemens and Halske, Berlin, is interested in the following companies:—

- Det Norske Radioselskap (System Teunken), Kristiania.
- Deutsche Betriebsgesellschaft für drahtlose Telegrafie m.b.H., Berlin (Debeg).
- Deutsche Ubersee-Gesellschaft für drahtlose Telegrafie A.-G., Berlin.
- Drahtloser Ubersee-Verkehr, A.-G., Berlin (Transradio).
- Ellvesa G.m.b.H., Berlin.
- Société Anonyme Internationale de Télégraphie sans Fil, Brussels.
- Società Radioelettria Italiana, Rome.
- Svenska Aktiebolaget Tradloes Telegrafi, Stockholm.
- Telefunken-Marconi, Code A.-G., Berlin.
- Telefunken, Ostasiatische Gesellschaft für drahtlose Telegraphie m.b.H., Shanghai.
- Transradio Compañia Radiotelegráfica Argentina S.A., Buenos Aires.

Independent Wireless Telegraph Company, Inc.

Incorporated.—February 12th, 1919, in the State of Delaware, U.S.A.

Head Office.—42, Broadway, New York City, New York, U.S.A.

European Office.—7, Hobart Place, London, S.W.1, England.

Factory.—Port Chester, New York, U.S.A.

Directors.—P. R. Mallory, C. J. Pannill, C. D. Mallory, and Frank C. Munsen.

President.—P. R. Mallory.

Vice-President and General Manager.—C. J. Pannill.

Treasurer.—F. H. Seeley.

European Superintendent.—D. J. Heilig.

Capital and Dividends.—Close Corporation.

The Company was formed for the operation of wireless telegraphy and the manufacture of wireless telegraph apparatus.

Marconi International Marine Communication Company, Limited (The)

Incorporated.—April 25th, 1900.

Head Office.—Marconi House, Strand, London, W.C.2.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc. (Chairman), Godfrey C. Isaacs (Deputy Chairman and Managing Director), Alfonso Marconi, Capt. H. Riall Sankey, C.B., C.B.E., R.E. (retired), Henry W. Allen, F.C.I.S., W. W. Bradfield, C.B.E., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., and Lt.-Col. A. Simpson, C.M.G., R.E. (retired).

Joint General Managers.—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., and Lt.-Col. A. Simpson, C.M.G.

Assistant General Managers.—G. E. Turnbull and H. W. Corby, F.C.I.S.

Secretary.—A. Ogle, M.C., A.C.I.S.

Marine Superintendent.—Capt. C. V. Daly.

Traffic Manager.—

Contract Manager.—A. R. Harding.

Technical Manager.—Commander J. A. Slee, C.B.E., R.N.

Capital.—£1,500,000 in shares of £1 each, issued and fully paid £1,192,726. (The capital was increased in May, 1919, by 900,000 shares of £1 each, of which 600,000 were offered to existing shareholders pro rata at par.) 5½ per cent. First Mortgage debentures (bearer)—authorised £250,000, issued £125,000, outstanding £68,100. Secured (without trust deed) as a floating charge on the undertaking and all the property. Redeemable at par, July 1st, 1941. Interest payable, January 1st and July 1st.

Accounts and Dividends.—Accounts are made up to December 31st and usually submitted in June following. The accounts at December 31st, 1920, showed, after deduction of £54,000 paid on account of Excess Profits Duty, a profit of £225,461, which included the amount brought forward. After payment of dividend £46,552 was carried forward subject to Excess Profits Duty for years 1916 to 1920 inclusive, less amount paid on account, and Corporation Profits Tax for 1920.

Dividends paid, 1910, 5 per cent.; 1911, 7 per cent.; 1912, 1913 and 1914, 10 per cent.; 1915, 12½ per cent.; 1916, 1917, 1918, 1919 and 1920, 15 per cent.

Last Bearer Coupon paid, No. 19.

This Company was formed for the purpose of working throughout the world, except in the United States of America, Hawaii, Chili, and colonies or dependencies of those States, an exclusive license for all maritime (being mercantile or yachting) purposes granted by Marconi's Wireless Telegraph Company, Limited. The Company has transferred to Associated Companies its rights in Canada, Argentina, Uruguay, Australasia, and all European countries and their dependencies except the United Kingdom and Italy. This Company owns and operates the wireless telegraph apparatus on over 3,000 vessels of the mercantile marine.

Marconi Scientific Instrument Company, Limited (The)

Incorporated.—November 1st, 1919.

Registered Office and Works.—21/25, St. Anne's Court, Dean Street, Soho, London, W.1.

Directors.—William W. Drury (Managing Director), Henry W. Allen, F.C.I.S., W. W. Bradfield, C.B.E., C. Mitchell, Chas. B. Ward.

Secretary.—Arthur J. Wheeler, A.C.I.S.

Capital.—Authorised £20,000 in 20,000 shares of £1 each.

The Company was formed to manufacture and sell amateur wireless telegraphic and telephonic apparatus under license from Marconi's Wireless Telegraph Company, Limited. Also to manufacture and market all classes of land-line and submarine cable apparatus.

"Marconi" Societate Anonima Românâ Pentru Industria Si Comertul de Materiale Telegrafice, Telefonice Si Electrice

Incorporated.—April 5th, 1920.

Amalgamated with "Radioelectrica" Societate Anonimâ Românâ pentru industria si comertul materialelor telegrafice si telefonice, with effect from October 27th, 1921.

Present Name.—"Radioromana" Societate Anonimâ Românâ pentru industria si comertul materialelor telegrafice si telefonice.

Address of Head Office.—4, Strada Saguna, Bucharest.

Directors.—Prince Barbu Stirbey (President), C. P. Olânescu (Vice-President), N. Vasilescu-Karpen, Godfrey Isaacs, Colonel J. E. Cochrane, D.S.O., Alex. Tzigara-Samurcas, Capt. Edwin Boxshall, C. D. Busilâ, Cezar Boerescu, D. Leonida, Emile Girardeau, Paul Mangard.

Managing Directors.—C. Busilâ, Colonel J. E. Cochrane, D.S.O., Paul Mangard.

General Manager.—Eugen Craioveanu.

Secretary.—Major A. A. O'Kelly.

Capital.—12,000,000 lei. 24,000 fully paid-up shares of 500 lei each.

The Company was formed for the manufacture, supply and installation of all kinds of telegraphic and telephonic apparatus, including wireless.

Marconi Wireless Telegraph Company of Canada, Limited (The)

Head Office.—Marconi Building, 9-11-13, Saint Sacrament Street, Montreal, Canada.

President.—A. E. Dyment.

Vice-Presidents.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., Robert Bickerdike.

Directors.—Sir William Mackenzie, Godfrey C. Isaacs, G. M. Bosworth, C. G. Greenshields, K.C.

Managing Director.—A. H. Morse, A.M.I.E.E. (London), Member I.R.E. (New York).

Manager.—A. L. W. MacCallum.

Comptroller and Acting Secretary.—J. P. Fleming.

Traffic Manager. —G. H. Pearson, Assoc.I.R.E. (New York).

Chief Engineer. —J. O. G. Cann, M.I.(A.)E.E., Fellow I.R.E. (New York).

Authorised Capital.— $7,500,000 in 3,000,000 shares of $2.50 each.

Issued Capital.—2,200,000 shares.

The Company has sole wireless rights under all Marconi and General Electric Company patents in the Dominions of Canada and Newfoundland. It is the only Company in Canada manufacturing wireless apparatus and providing wireless service. It owns and operates the wireless equipment on over two hundred ships of the Canadian and Newfoundland Mercantile Marines, and also owns and operates the duplex, transatlantic, commercial wireless telegraph station at Glace Bay in Nova Scotia.

The Company operates under contract with the Canadian and Newfoundland Governments, about forty wireless stations in the Great Lakes, Gulf of St. Lawrence, and on the Atlantic Coast. It has branch offices in Vancouver, B.C., Toronto, Ont., St. John, N.B. (winter), and St. John's (Nfld.). It owns and operates schools of radiotelegraphy in Montreal, Toronto, and St. John's Nfld.).

Marconi's Wireless Telegraph Company, Limited

Incorporated.—July 20th, 1897, as "Wireless Telegraph and Signal Co., Ltd."; name changed as above in March, 1900.

Head Office.—Marconi House, Strand, London, W.C.2.

Works.—Chelmsford, Essex.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc. (Chairman), Godfrey C. Isaacs (Deputy-Chairman and Managing Director), Captain H. Riall Sankey, C.B., C.B.E., R.E. (retired), Alfonso Marconi, W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., and Lt.-Col. Adrian Simpson, C.M.G., R.E. (retired).

Joint General Managers.—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S., and Lt.-Col. Adrian Simpson, C.M.G., R.E. (retired).

Assistant General Managers.—G. E. Turnbull and H. W. Corby, F.C.I.S.

Secretary.—A. Ogle, M.C., A.C.I.S.

Chief Engineer.—Andrew Gray, M.I.E.E., A.M.Inst.C.E.

The Company was formed to acquire Senatore Marconi's patents for wireless telegraphy in all countries except Italy, its colonies and dependencies, and has since acquired a large number of other patents relating to wireless telegraphy, including those of Sir Oliver Lodge, the General Electric Company of New York (except for America), etc.

It has substantial interests in various subsidiary and affiliated Companies.

The Company conducts public wireless telegraph services, and messages are accepted for transmission, via Marconi, to the United States of America, Canada, Australia, New Zealand, the West Indies, British Guiana, British Honduras, Spain, France, Switzerland, etc.

Accounts and Dividends.—Accounts are made up to December 31st, and usually submitted in June following. The Company's accounts at December 31st, 1920, showed shares in Associated Companies and Patents, £2,941,517 (par value of shares, £3,488,847), and General Reserve Account £4,001,368. The profit for the year, together with the balance brought forward, was £1,242,134, and after payment of dividends, £820,567 was carried forward.

In respect of each of the years 1911, 1912 and 1913, the Company paid dividends of 17 per cent. on the Preference shares and 20 per cent. on the Ordinary shares; in respect of 1914 and 1915, 7 per cent. Preference and 10 per cent. Ordinary dividends were paid; in respect of 1916 the dividends were 12 per cent. on the Preference shares and 15 per cent. on the Ordinary shares; in respect of 1917 the dividends were 17 per cent. on Preference shares and 20 per cent. on the Ordinary shares. For 1918 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid. For 1919 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid, plus a bonus of 5s. per share on both Preference and Ordinary shares. For 1920, dividends of 12% on the Preference shares and 15% on the Ordinary shares were paid.
(Last Bearer Coupons paid: No. 21 Preference, No. 20 Ordinary.)

Capital.—Authorised £3,000,000 in 2,750,000 Ordinary shares of £1 each, and 250,000 Cumulative Participating Preference shares of £1 each. The Preference shares are entitled to a cumulative dividend of 7 per cent., and, after the Ordinary shares have received a 10 per cent. non-cumulative dividend, to share *pari passu* with the latter shares in surplus profits remaining. Issued (October, 1921) 250,000 Preference shares and 2,636,906 Ordinary shares. In November, 1919, the authorised capital was increased by the creation of 1,500,000 Ordinary shares, which were offered in December 1919, to existing shareholders *pro rata* at a premium of £2 per share.

Nederlandsche Seintoestellen Fabriek

Incorporated.—February 27th, 1918.

Head Office and Works.—Jan v. d. Heydenstraat, Hilversum, Holland.

Directors.—Bern E. Ruys (President), D. Hudig L. Jzn (Commissaire Délégué), A. J. M. Goudriaan, J. H. Hummel, A. E. J. Bertling, A. Veder, G. C. Isaacs, G. E. Turnbull, J. Rypperda Wierdsma.

Manager.—A. Dubois.

Capital.—2,000,000 florins, divided into 2,000 shares of 1,000 florins each.

The financial year ends December 31st.

The Company was formed for the purpose of exploiting a factory or factories for the manufacture of installations, apparatus and tools destined for or relating to wireless telegraphy, telephony, signalling apparatus, etc., and trading in the above-mentioned apparatus. It has entered into an agreement with Marconi's Wireless Telegraph Company, Limited, whereby the latter Company grants to the N.S.F. the exclusive right to manufacture and sell in Holland and the Dutch Colonies wireless material according to its Patents and designs, present and future.

Nederlandsche Telegraaf Maatschappij, "Radio-Holland"

Incorporated.—December 6th, 1916.

Head Office.—562 Keizersgracht, Amsterdam.

Directors.—D. Hudig L. Jzn (President), J. Rypperda Wierdsma, A. J. M. Goudriaan, J. Wilmink, P. J. Roosegaarde Bisschop, H. Colyn, Prof. C. L. van der Bilt, J. E. van Hengel, Senatore G. Marconi, Godfrey C. Isaacs, Maurice Travailleur, Gaston Périer.

Managing Directors.—L. H. F. Waekers and Th. P. van der Bergh.

Administrator, Dutch East Indies.—W. A. J. Liebert.

Capital.—3,000,000 florins, divided into 3,000 shares of 1,000 florins each, of which 2,000 shares have been issued and fully paid.

The financial year ends at December 31st.

The Company was formed for the purpose of the establishment, sale, hire, control and exploitation of wireless telegraph and wireless telephone stations in Holland and its colonies.

Norsk Marconikompani Aktieselskap

Constituted.—November 28th, 1918.

Head Office.—Karl Johansgate 5, Kristiania.

Branch Office.—Nygaardsgaten 13, Bergen.

Capital.—1,250,000 Kroner, divided into 1,250 registered shares of Kroner 1,000 each.

Directors.—Consul-General O. J. Storm, C.B.E. (Chairman), Commander J. Bull, Godfrey C. Isaacs, Commander B. L. Gottwaldt, E. S. Skottun, Otto Thoresen, and Maurice Travailleur.

Deputy Directors.—A. Hubert, G. B. Turnbull, and K. Zimmer.

Managing Director.—O. J. Storm, C.B.E.

Deputy Managing Director.—E. S. Skottun.

Manager.—B. L. Gottwaldt.

This Company was constituted for the manufacture, sale, and rental of apparatus for Wireless Telegraphy, Telephony, Signalling, etc., and other business in connection therewith. It has acquired the Marconi patent rights, present and future, for exploitation in Norway and on board ships flying the Norwegian flag.

Pan-American Wireless Telegraph and Telephone Company (The)

Incorporated.—State of Delaware, U.S.A. Amended Certificate of Incorporation, October 18th, 1917.

Offices.—233, Broadway, New York City.

Directors.—Hon. John W. Griggs, Edward J. Nally, James R. Sheffield, David Sarnoff, Edward W. Harden, Albert G. Davis, C. B. Coady, R. Mainzer, R. P. Schwerin.

Chairman.—Hon. J. W. Griggs.

President and General Manager.—Edward J. Nally.

Vice-President and Commercial Manager.—David Sarnoff.

Vice-President.—Powhatan Page.

Secretary.—Charles J. Ross.

Treasurer.—George S. De Sousa.

Assistant Secretary and Assistant Treasurer.—L. MacConnach.

Capital.—3,500 shares 7 per cent. preferred stock of $100 each, cumulative after January 1st, 1921; 50,000 shares common stock, no par value. The financial year ends December 31st.

The Company has the exclusive right and license to use the Marconi and Poulsen Patents for the sole purpose of radio or wireless communication between the United States of America and all countries of South America, Central America, Mexico, the Islands of Cuba, Porto Rico, and the West Indies.

Radio Communication Company, Limited

Incorporated.—March 14th, 1919.

Head Office.—34/35, Norfolk Street, London, W.C.2.

Directors.—T. W. Stratford-Andrews (Chairman), Sir Wm. R. Brooke, K.C.I.E., J. Herbert Scrutton, B. Binyon, O.B.E. (Managing Director).

General Manager.—A. B. Snoaden.

Secretary.—W. H. C. Rowe, C.B.E.

Capital.—£200,000, divided into 100,000 6 per cent. Cumulative Participating Preference shares and 100,000 Ordinary shares. Issued: 79,502 Ordinary and 81,650 Preference.

The Company was formed under the ægis of the Indo-European Telegraph Company, Limited, for the manufacture, sale and operation of radio apparatus, including "Polar" radio equipment for ships.

Radio Corporation of America

Incorporated.—October 17th, 1919, in the State of Delaware.

New York Office.—Woolworth Building, 233, Broadway, New York City.

Directors.—Owen D. Young (Chairman), E. J. Nally (President), E. W. Rice, Jun., Hon. John W. Griggs (General Counsel), James R. Sheffield, A. G. Davis, Gordon Abbott, Edward W. Harden F. A. Stevenson, W. S. Gifford, and George S. Davis.

Secretary. John W. Elwood.

Assistant Secretary.—L. MacConnach.

Comptroller.—Charles J. Ross.

Treasurer.—George S. de Sousa.

Assistant Treasurer.—M. H. Payne.

Capital.—Authorised: $25,000,000 Preferred Stock in 5,000,000 shares of $5 each. There are also 7,500,000 Common shares of no par value. Issued: $14,023,670 in 2,804,734 Preferred shares of $5 each, fully paid. 5,580,760 Common shares of no par value. Rights: The Preferred Stock is entitled to receive dividends of 7 per cent. per annum and no more. In any distribution of the assets it is entitled to be paid off at par, prior to any payment to the Common shareholders. The Preferred dividends are cumulative after the fiscal year ending in or with the calendar year 1923, and the Preferred Stock may be retired on any day on which a dividend thereon shall be payable, at $5.50 per share and accrued dividends.

The Company was formed to acquire certain assets of The Marconi Wireless Telegraph Company of America and all wireless inventions, present and future, of the General Electric Company of New York.

R.M. Radio Limited

Registered.—September 6th, 1919.

Head Office and Engineers' Offices and Show-rooms.—5, Regent Square, Gray's Inn Road W.C.1.

Directors.—H. K. Rivers Moore, W. H. Merriman, L. J. Graham, A. G. Ionides, C. N. Rivers Moore.

Secretary.—W. H. Merriman.

Capital.—£10,000.

The Company was formed for the purpose of constructing, supplying, maintaining and operating radiotelegraphic and telephonic apparatus of all kinds for the purpose of intercommunication on land, at sea, and in the air.

Russian Company of Wireless Telegraphs and Telephones (The)

Incorporated.—October 8th, 1908.

Head Office.—14, Lopouchinskaja, Petrograd, Russia.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., G. C. Isaacs, S. M. Eisenstein, Pierre de Balinski, M. Salberg, Lt.-Col. Adrian Simpson, C.M.G., R.E. (Managing Director), Admiral I. F. Bostrem, I.R.N. (retired), L. M. Eisenstein (Deputy Director).

Secretary.—Leon Eisenstein.

Capital.—Originally 1,200,000 roubles in 12,000 shares of 100 roubles each. This capital was increased to 1,800,000 roubles in November, 1911, in order to enable the Company to acquire a license from Marconi's Wireless Telegraph Company, Limited. The capital was further increased in 1913 to 2,400,000 roubles, and in 1914 to 3,000,000 roubles, divided into 30,000 shares of 100 roubles each.

The financial year ends December 31st (Russian date).

Dividends.—In respect of the years 1912 and 1913 dividends of 6 per cent. have been paid and 15 per cent. in respect of 1914 and 1915, and 17 per cent. for 1916.

The Company owns the Russian patents taken out in the name of S. M. Eisenstein, and also holds an exclusive license to use and exploit the Marconi Company's patents in Russia (excluding stations for international communication or on vessels of Russian Mercantile Marine).

(N.B.—Owing to the political situation in Russia it has not been possible to revise the particulars concerning the above Company.)

Societa' Anonima Fiumana per le Radio Comunicazioni

Chairman.—Senatore Guglielmo Marconi.

Managing Director.—Marquis Luigi Solari.

Directors.—Ing. Giovanni Rubinich, Prof. Arturo De Meichsner.

Censeurs.—Avv. Ernesto Franchi, Sig. Giovanni Santini, Sig. Giulio Bresci, Sig. Annibale Ploech.

Capital.—L150,000—(Authorised L1,500,000).

Societa' Italiana Dei Servizi Radiotelegrafici e Radiotelefonici

Head Office.—Corso Umberto 1, 271, Rome.

Chairman.—Senatore Guglielmo Marconi.

Managing Director.—Marquis Luigi Solari.

Directors.—Senatore Angelo Salmoiraghi, Senatore Ernesto Presbitero, Generale Maurizio Mario Moris.

Censeurs.—Comm. Cesare Cazzulini, Comm. Francesco Pages, Mr. Arthur Cappelaere.

Joint Censeurs.—Ragioniere Mario Fogliani, Avv. Michele Di Rienzo.

Capital.—L1,000,000—(Authorised L10,000,000).

Société Anonyme Internationale de Télégraphie Sans Fil

Incorporated.—March 31st, 1913.

Head Office.—13, Rue Bréderode, Brussels.

Capital.—4,500,000 francs, divided into 9,000 shares of 500 francs each, all issued and fully paid.

The last dividend paid was 20 per cent. for the year 1920.

The financial year ends at December 31st.

The Company exploits wireless telegraphy on vessels of the mercantile marine of all European countries excepting the United Kingdom of Great Britain and Ireland, Germany, Austria-Hungary, Italy and France, and at the present time owns and operates wireless telegraph apparatus on nearly 600 vessels.

Société Française Radio-Electrique, Société Anonyme

Incorporated.—April 4th, 1910.

Head Office.—79, Boulevard Haussmann, Paris.

Laboratory.—Suresnes (Seine), 51, Rue Carnot.

Works.—Levallois-Perret (Seine), 2, Quai Michelet.

Big Machine Works.—Belfort: Société Alsacienne de Constructions Mécaniques.

Tower and Pillar Works.—Venissieux (Rhône), 72, Chemin du Moulin à Vent à Parilly.

Chairman.—M. Henri Bousquet.

Vice-Chairman.—M. G. Ferrand.

Financial Directeur.—M. A. Fondère.

Managing Director.—M. E. Girardeau.

Directors.—Comte de Beaumont, Baron de La Chevrelière, P. Desachy, A. Dupont, N. Pietri, O. de Rivaud.

Technical Manager.—Major P. Brenot.

Technical Advisers.—MM. Bethenod, Latour, Boucherot, de Bellescize, Petit.

Capital.—7,000,000 francs, divided into 70,000 shares of 100 francs each, all issued and paid up.

The Company manufactures wireless telegraph apparatus and engines, and erects wireless stations, and also owns and operates the patents of MM. J. Bethenod, E. Girardeau, M. Latour, etc.

It exploits chiefly that system of wireless telegraphy which employs high-frequency machines, the system adopted for all the great stations of France and its Colonies and by various other Governments.

Société Independante Belge de Telegraphie Sans Fil, Société Anonyme

Incorporated.—January 29th, 1920.

Head Office.—23, Boulevard de Waterloo, Brussels.

Directors.—M. le Baron Henri Lambert (President), MM. Braillard (Managing Director), De Formanoir Vanderhaeghen, Van Halteren.

Manager.—M. Jamotte.

Capital.—1,000,000 francs, divided into 2,000 shares of 500 francs each.

Société Indépendante de Télégraphie sans Fil

Head Office.—66, Rue la Boëtie, Paris.

Works and Laboratory.—Malakoff 76 Route de Châtillon.

Administrators.—M. M. Boé (Président), F. Bézerie, Chéronnet, Maurice, E. Wormser.

Managers.—Mr. R. Braillard (technical); Mr. J. Hubert (commercial).

Technical Advisers.—M. le Docteur L. Brillouin, M. M. R. Barthelemy, G. Beauvais, M. Guéritot, Laut, Poncet.

Capital.—1,500,000 francs, divided into 3,000 shares of 500 francs each, issued and fully paid.

The Company manufactures wireless telegraph and telephonic apparatus, including valves, and constructs and maintains wireless stations, both land and ship. The Company operates the patents of MM. Bardeloni, R. Barthelemy, G. Beauvais, R. Braillard, L. Brillouin, R. B. Goldschmidt M. Guéritot, P. J. Laüt, Pellin, Pelletier, etc.

Wireless Speciality Apparatus Company

Incorporated.—June 14th, 1907, New York.

Head Office.—131, State Street, Boston.

Directors.—George S. Davis, William Newsome, Eugene W. Ong, C. B. Davis, R. H. Rice, E. P. Edwards.

President.—George S. Davis.

Vice-President.—William Newsome.

Secretary.—John L. Warren.

Treasurer.—E. C. Porter.

General Manager.—T. Johnson, Jr.

Chief Engineer.—William H. Priess.

Consulting Engineer.—Professor Greenleaf W. Pickard.

Capital.—$192,000.

The fiscal year ends December 31st of each year.

The Company is engaged in the development and manufacture of radio apparatus and devices, and of "Faradon" condensers for both high and low tension work, including condensers of special design for continuous wave radio apparatus.

BIOGRAPHICAL SECTION

(A) Biographies.

(B) Obituary Notices.

BIOGRAPHICAL NOTICES

Abraham, Henri.—General Secretary of the Société Française de Physique, 1901 to 1913, now Professor of Physics at the Sorbonne in Paris.

Adalsteinsson, F.—Born at Akureyri, Iceland, December 30th, 1890. Since 1908 engaged in the Iceland Government Telegraph Service. Studied wireless telegraphy in Norway and Denmark in 1916 and 1917. Since February, 1917, Superintendent of Reykjavik Wireless Station and School. Supervised erection of four wireless coast stations in Iceland. Inspector of wireless installations in that country. Address, Loftskeytastodin, Reykjavik, Iceland.

Alexanderson, Ernst Fredrik Werner.—Chief Engineer, Radio Corporation of America. B. Upsala, Sweden, January 25th, 1878. Educ, at the High School and University of Lund. Sweden, and at the Royal Institute of Technology, Stockholm, completing a post-graduate course at Berlin. Entered the service of the C. and O. Electric Company, 1901. Joined the General Electric Company, 1902. Occupies the post of consulting engineer to the latter concern. Introduced iron into the manufacture of high frequency circuits, and originated the development of 2, 50 and 200 kw. radio frequency alternators and the magnetic amplifier. The first 200 kw. radio frequency alternator and magnetic amplifier for radiotelegraphic work designed by Mr. Alexanderson was installed in the Marconi Company's station at New Brunswick, N.J., and has now been adopted by the Radio Corporation of America for all of its high power stations. Also developed the "barrage" receiver and kindred inventions. Has carried on notable pioneer work in duplex radio telephony. Holds a number of United States patents. Member of the American Institute of Electrical Engineers. Fellow and President of the Institute of Radio Engineers. Author of over twenty scientific papers read before various technical societies. Address : Woolworth Building, New York.

Allen, Henry W., F.C.I.S. (1902), Joint General Manager, Marconi's Wireless Telegraph Company, Ltd., and Marconi International Marine Communication Company, Ltd. (1910). B. 1870. Met Senatore Marconi, 1896. Assisted (1897) in formation of the Wireless Telegraph and Signal Co., Ltd., afterwards becoming secretary to that company. Secretary of Marconi International Marine Communication Co., Ltd., and Assistant Manager of Marconi's Wireless Telegraph Co., Ltd. (1900). Deputy Manager, Marconi's Wireless Telegraph Co., Ltd. (1910). Elected to a seat on the Board of each company, 1917.

Appleby, Thomas.—B. May 10th, 1886, near Newcastle-on-Tyne, England. Arrived in America, 1888. Commenced wireless experiments, 1899. Went to sea, 1909, as radio operator. September, 1909, in charge of United Wireless Station at Atlantic City, N.J. April, 1912, in charge of Wanamaker-Marconi Service between New York and Philadelphia Wanamaker Stores. April 9th, 1917, commissioned in the U.S. Navy as a Lieutenant (J.G.) for Radio Engineering. Ordered to the Office of the Director of Naval Communications, Navy Department, Washington, D.C. Author of U.S. "Wartime Radio Instructions for Merchant Vessels." Spring of 1918, established shore radio compass stations for the detection and location of enemy vessels in West Atlantic. Selected the sites and supervised the erection, installation and calibration of shore radio compass stations erected on Atlantic coast of United States from Cross Island, Maine, to Gulf of Mexico. Spring of 1919, selected sites for shore radio compass stations on the Pacific Coast of the United States. April 24th, 1919, promoted Senior Lieutenant, U.S. Navy. August 7th, 1919, released from active duty, U.S. Navy. August 8th, 1919, Radio Engineer in the Office of the Director of Naval Communications and given entire charge of all shore radio compass stations in the United States. November 15th, 1919, resigned from Navy Department to enter profession of Patent Lawyer. Full Member of the Institute of Radio Engineers, New York. Address: 5847, Ellsworth Street, Philadelphia, Pa., U.S.A.

Appleton, Edward Victor, M.A. (Cantab.), M.Sc. (Lond.), Fellow of St. John's College, Cambridge. B. Bradford, 1892. Educ. St. John's College, Cambridge. First-class Honours in National Science Tripos, Parts I. and II. (Physics). Served European War, 1914-1919, as Captain W/T, R.E. Specially interested in Thermionic Valves. Engaged in Valve Research, Cavendish Laboratory, Cambridge. Member of Thermionic Valve Sub-Committee, Radio Research Board, Department of Scientific and Industrial Research. Address: St. John's College, Cambridge.

Arco, Graf Georg von.—B. Grossgorschütz, Hersklesien. Educ. at Berlin University and Technical High School, Charlottenburg. Assistant to the late Professor Slaby in the department of wireless telegraphy, 1898; later joined the Allgemeine Elektrizitäts Gesellschaft, Berlin, continuing at the same time his work on the Slaby-Arco system of wireless telegraphy. Manager of the Gesellschaft fur Drahtlose Telegraphie, 1903. Carried out practical wireless telephony over a distance of 35 km. (21.7 miles), 1906. Exhibited high frequency alternator with static frequency step-up transformers at the International Radiotelegraph Congress in London, 1912. This arrangement is now used in the high power-station of Nauen, generating 400 kw. in the aerial and used for telegraphy and telephony. Address: Tempelhof, Berlin, Albrechtstrasse 49/50.

Armstrong, Edwin H., Professor at Columbia University and President of the Radio Club of America. B. in U.S.A., December 18th, 1890. Graduated at Columbia University in 1913. Has undertaken radiotelegraphic work in conjunction with Professor Pupin at the Columbia Laboratories. He is himself a director of the Institute of Radio Engineers, and was recently awarded the medal of the Institute. Served two years in A.E.F. as Captain and Major in the Signal Corps. Decoration: Chevalier

Légion d'Honneur. Address: Columbia University, New York City.

Asano, Dr. Osuke.—B. 1859. Graduated at the Engineering College of the Tokyo Imperial University, 1881. Honorary Professor, Tokyo University. Director of the Electro-Technical Laboratory of the Department of Communications, 1897. Retired, 1919. Took many trips to Europe and America, first for the investigation of electrical engineering; second as a Japanese delegate of the International Wireless Telegraph Conference, Berlin, 1906; and third as a Japanese delegate of the International Conference on Electrical Units and Standards, London, 1908. Pioneer of wireless investigation in Japan, and his investigation has continued since 1897. The so-called "Telshinsho" wireless system is due to his investigations. Laid the submarine cable between Formosa and Osumi in 1895-97, the first long-distance submarine cable ever laid by a Japanese. Raised to the rank of Dr. Engineer, 1899. Supervises all electrical works in Japan. Awarded 2nd Order of Merit, 1914. Address: 148, Kogaicho, Azabu, Tokyo.

Asin, Don Humberto de, Engineer-in-Chief of the Radiotelegraph Service of Bolivia. Studied electricity at the University of Santiago. Chief of important technical sections, railways of Guaqui y Arica at La Paz. Studied radiotelegraphy. Visited San Cristobal, Lima, the School of Santiago, and the two installations which were then at the Docks, Buenos Aires. Commissioned by Bolivian Government to visit Europe. Graduated as radiotelegraphist at the Marconi Company's professional school at Broomfield. Visited Germany to study the Telefunken system. Installed six stations in Bolivia and Trinidad, Cobija. Villa Bella, Concepcion, Magdalena, San Ignacio, Puerto Suárez, Santa Cruz, Todos Santos and many more.

Athanasiadis, Capt. C.—B. Athens, 1878. Educ. Royal Naval College, 1892. Commissioned in the Navy, 1896, and after eleven years' active service became interested in wireless telegraphy. Supervised the erection of the first wireless installations in Greece. Sent to London, 1909, by his Government as the head of a mission for the construction of Greek wireless stations. Remained in England for a year and a half, and during that period came into close contact with the Marconi organisation. On his return to Greece he was appointed head of the Radiotelegraph Service of the Navy. In November, 1920, he resigned his commission in the Royal Navy, and in 1921 became sole agent for Greece of Marconi's Wireless Telegraph Co., Ltd., and of the Société Anonyme Internationale de T.S.F. He is the author of the standard Greek instructional books on wireless, and has achieved some successes in the realms of poetry and the drama. Address: 45, Nikis Str., Athens.

Austin, Louis Winslow, Ph.D., D.Sc.—Head of the U.S. Naval Radiotelegraphic Laboratory, Washington, D.C., since 1908. Son of Professor L. A. Austin, of Middlebury College. Educ. Middlebury College, Clark University, and the Universities of Strassburg and Berlin. Assistant Professor of Physics at the University of Wisconsin, then joined the staff of the Physikalisch-Technische Reichsanstalt, Berlin. Specially interested in quantitative high-frequency measurements. Delegate to the London International Radiotelegraphic Conference; President of the Institute of Radio Engineers, 1914; Vice-President of the International Union for Scientific Radiotelegraphy; Delegate to the Radiotelegraphic Technical Conference, Paris, 1921. Address: Radio Building, Bureau of Standards, Washington, D.C.

Ballantine, Stuart.—B. September 22nd, 1897. Philadelphia, Pa. Educ. Philadelphia Public Schools, studied mathematics at Drexel Institute. Engaged in electro-chemical research, H. K. Mulford Company, 1916; and telephone engineer, Bell Telephone Company, 1916-17. Took up development of radio compass for U.S. Navy Department, and was in charge of this work from 1917-20. At present pursuing special studies in mathematical physics at Harvard University. Address: 15, Sumner Road, Cambridge, Mass., U.S.A.

Bangay, Raymond D.—B. Lyme Regis, 1883. Educ. Epsom College and Finsbury Technical College. Joined the Marconi Company, 1902. Spent five years in America, during which time was engaged in different branches of the Service. Returned to England and studied Military Wireless Stations. Chief of the Field Station Department, Marconi's Wireless Telegraph Co., Ltd., 1914. Chief of Designs Department, of the same company, 1921. Author of "The Elementary Principles of Wireless Telegraphy" and "The Oscillation Valve." Address: Gresham Cottage, Brentwood, Essex.

Beggerow, Dr. Hans.—B. September 30th, 1874. Educ. University of Berlin and Freiburg-in-Breisgau, where he obtained his Doctorate. From 1901 till 1919 chief expert adviser to the German Admiralty in all matters concerning wireless telegraphy. Similar position in the Prussian Army, 1906-14. Delegate of the Imperial German Government to the three International Radio Conferences of 1903, 1906, and 1912. Retired November, 1919. Occupied with private scientific work only. Address: Berlin, W.15, Meierottostr, 3.

Bellini, Dr. Ettore.—B. Foligno, Italy, April 19th, 1876. Educ. Naples University. Electrical Engineer to the Royal Italian Navy, 1901. Chief of the Naval Electrical Laboratory at Venice, 1906. Responsible for carrying out research work dealing with the employment of wireless telegraphy on warships and submarines. Joint inventor with Capt. Tosi, of the Radio-goniometer.

Bethenod, J. F. J.—Consulting Engineer to the French Société Radio-Electrique. B. Lyons, 1883. Educ. Central School of that city. For a number of years acted as the Assistant of Professor André Blondel. From 1903 onward, published a large number of theoretical articles on Electro-Dynamic Machinery, and has entered into business relationship with a number of Constructional Engineering Houses for the exploitation of his inventions. After a term of military service in the Engineers, specialised in wireless telegraphy. In this field, both scientific investigation and industrial practice owe several important contributions to his activities. A number of wireless stations of varying power have been installed, wherein his devices are utilised. Of recent years, M. Bethenod has turned his attention to high-frequency alternators, and has built machines giving remarkable results.

Bhering, Francisco, Professor of Geodesy and Astronomy in the Polytechnic School of Rio de Janeiro. Director of the Technical Branch of the Telegraphic Administration. B. Uberaba, State of Minas Geraes, Brazil, January 1st, 1867. Under his initiation and supervision survey and mapping of Brazil undertaken in unified maps

on the scale of one millimetre per kilometre. Represented Brazil as delegate at the International Telegraphic Conference of 1903, at the Radiotelegraphic Conference, London, in 1912, and at the Time Conference, 1912. Member of the mixed Civil and Military Commission organised to deal with wireless matters. Author of a number of works on civil engineering, geography, and telegraphy. Address: Rua Conde Irajá No. 111, Rio de Janeiro, Brazil.

Binyon, Major Basil, O.B.E., B.A., A.M.I.E.E., Managing Director Radio Communication Company, Ltd.—B. Ipswich, April 23rd, 1885. Educ. Leighton Park, Reading; Trinity College, Cambridge. Took B.A. degree Natural Science Tripos, 1907, and post graduate course Electrical Engineering. Appointed engineer to Cie. Generale Radiotelegraphique of Paris, 1911. Appointed General Manager Anglo-French Wireless Co. Granted commission in R.N.A.S., 1914. Appointed Officer-in-Charge Wireless Experimental Department of R.N.A.S., 1916. Promoted Squadron Commander, 1917. Awarded O.B.E. (military), 1918. Appointed Major R.A.F. Member of the Institute of Radio Engineers. Vice-Chairman, Wireless Society of London. Address: 34, Norfolk Street, Strand, W.C.2; "Hawthorndene," Hayes, Kent.

Bjarnov, Alexander William.—Telegraph engineer; Engineer-in-Chief of the Danish Telegraph Dept.'s Third Engineering District; Fellow of Danish Engineers' Association and of the Electrotechnic Association (Elektroteknisk Forening); member of the Board from 1911 to 1919; Associate of the American Scandinavian Foundation. B. Copenhagen, 1874. Studied Polytechnic Academy, Copenhagen. Attached to the Telegraph Dept. since 1903. Passed through the Naval and Torpedo Department Spark Telegraph School for Officers in 1907. Since 1909, together with Helmuth Schledermann, has supervised the examination of wireless operators and the inspection of wireless stations on board ships flying the Danish flag. Address: Gl. Kongevej 96, Copenhagen V.

Bjoerkman, S. O. V.—B. 1883. Since 1911 Superintendent of the Wireless Station at Nya Varvet, near Gothenburg, Sweden. Address: Nordhemsgatan 33, Gothenburg.

Blandy, Col. Lyster Fettiplace, D.S.O., Controller of Communications at the Air Ministry; Officer of the Legion of Honour; Chevalier of the Order of the Crown of Belgium; Mons Star with bar; General Service and Victory Medals; Croix de Guerre of Belgium. B. September 21st, 1874. Educ. Haileybury College and Royal Military Academy, Woolwich. Entered Royal Engineers, March, 1895; Captain, 1904; Major, 1914. From 1908–12 Inspector Royal Engineers Stores at Woolwich, during which period he had much to do with Army Field Wireless Sets. In the start of 1913 took over command of a small unit of thirty to forty men, the Wireless Signal Company. From 1914–17 in charge of Wireless Communication of the B.E.F., France. Became Chief Experimental Officer of Army Signals Experimental Establishment, July, 1917. Chief Experimental Officer, R.A.F., April, 1918, and thence transferred to present post. Address: Naval and Military Club, London.

Blondel, André E.—B. Chaumont, France, 1863. Graduated at Paris University. Contributor to learned societies and technical journals on several subjects, including wireless telegraphy. Invented (1893) a new apparatus, which is known as the "Oscillograph," and which opened a fresh field for the study of alternate currents. Was the first to explain, mathematically (1893), the effect of inertia in the hunting of alternators. Among his other activities in wireless telegraph, mention should be made of directed waves produced by a double aerial oscillating on the fifth harmonic, and also of a system of acoustically syntonic wireless telegraphy.

Blondlot, Professor Prosper René.—B. Nancy, 1849. After completing his scientific studies in Paris, returned to Nancy. Became Professor at the Faculty of Sciences. Now Hon. Professor and Correspondent of the Institute of France. Devoted considerable study to the problem of electromagnetic waves, the main object of his researches being to determine the speed of propagation of such waves. In 1891 he found for this speed the value 302,200 km. per second, and, in 1893, by another and quite different method, the value 297,200 km. per second. Has also investigated the laws of propagation of wireless waves in various media.

Boys, Charles Vernon, F.R.S.—Officier de l'Instruction Publique (France); Hon. Member New York Academy of Sciences, also of Physical Society, Moscow; Past President Physical Society of London, Educ., Marlborough; Royal School of Mines. Is the author of numerous papers published by the Royal Society and others. Address: 66, Victoria Street, S.W.1.

Bradfield, William Walter, C.B.E.—Joint General Manager Marconi's Wireless Telegraph Company, Ltd., and Marconi International Marine Communication Company, Ltd. B. London, 1879. Entered the Wireless Telegraph & Signal Co., Ltd., 1897. Electrical assistant to Senatore Marconi all through the course of the latter's experimental work in Radiotelegraphy on Salisbury Plain during 1897. Installed the first wireless apparatus on British battleships, 1899, and a little later assisted in demonstrations to the United States Government on board the United States battleship "Massachusetts." In 1901 similar demonstrations conducted by him for the French Government resulted in the establishment of wireless communication between the French Riviera and Corsica. Supervised in 1901 the erection of the well-known station at Siasconset and the Nantucket Lightship. Chief Engineer to the Marconi Wireless Telegraph Co. of America, 1902. Deputy Manager of Marconi's Wireless Telegraph Company, and of the Marconi International Marine Communication Co., Ltd. Manager of both concerns, 1910. Elected to the Board of the two companies, 1917. Address: 1, St. James's Place, London, S.W.

Braillard, Raymond, General Manager, Société Indépendante Belge de Télégraphie sans Fil. B. 1888, Dept. of Jura, France. Studied engineering at the Ecole des Arts et Métiers, Cluny, and Ecole Superieure d'Electricité, Paris. Served two years in the electrical industry. Military service at the Eiffel Tower Wireless Station. Engineer of the Société Française Radio Electrique. Visited Belgian Congo (1911) as Chief Engineer of Wireless Telegraphy. Installed the network of Congoese Stations. Before the war installed the powerful station at Laeken, near Brussels. Secretary of the International Commission on Scientific Wireless Telegraphy. During the war attached first to the Wireless Service of the Belgian Army, then to the Wireless Station at Croix d'Hins (Bordeaux). Author of several scientific papers. Address: 23, Boulevard de Waterloo, Brussels.

Branly, Edouard.—B. Amiens, October 23rd, 1844. Educ. St. Quentin College and Henry IV

College, Paris. Fellow of the University, Doctor of Physical Science, and Doctor of Medicine. Some of his works relate to the electrical conductivity of radio-conductors. International Jury of Superior Precept Instruction awarded him (1900) *grand prix* for his exhibition of radio-conductors. French Minister of Public Instruction made him an Officer of the Legion of Honour in recognition of the part he had played in connection with the discovery of "Wireless Telegraphy." Has constructed various independent distributing apparatus for producing telemechanical effects without wires. Elected a member of the Academy of Science, Paris, January, 1911.

Brenot, Commandant Paul.—B. Ruoms, Ardèche, September 19th, 1880. Educ. Ecole Polytechnique. Transferred to the Central Establishment of Radiotelegraphy, and studied the installation of wireless at most of the military stations, both permanent and mobile. Represented wireless telegraphy at the International Electrical Congress at Marseille, 1908, and later on collaborated with M. Blondel in various investigations into the employment of frame aerials for radiogoniometry and high tension arcs for wireless telegraphy and telephony. Carried through some important experiments on the employment of wireless telegraphy in aircraft, 1910–11, which gained for their originator the Cross of the Legion of Honour. Before the war, head of the practical work in the advanced wireless school. Technical adviser to the Minister of the Colonies, 1911, and took over the organisation of the Colonial systems, particularly those applying to communication at a great distance. Delegate of the Colonial Office at the International Radiotelegraphic Conference, London, 1912; at the International Time Conference, Paris, 1912–13; and at the International Safety-at-Sea Conference, London, 1913–14. During the war, whilst remaining in charge of French Colonial wireless, appointed head of the Radiotelegraphic Centre at Paris and of the Eiffel Tower Station. Left Army, 1919. Became Technical Manager of the Société Française Radio-Electrique and of the Compagnie Générale de Télégraphie sans Fil.

Bright, Sir Charles, F.R.S.E., M.Inst.C.E., F.R.Ae.S., M.I.Mech.E., M.I.E.E., F.I.Radio.E., F.R.G.S., F.S.S., Principal of Sir Charles Bright & Partners, Consulting Engineers, 146, Bishopsgate, E.C.2.—B. London, 1863. Educ. Lancing College and King's College. Engineer and Electrician for the construction, testing, laying and repairing of over 25,000 miles of submarine cable. Gave special expert evidence before Inter-Departmental Cables Communication Committee (1902), House of Commons Radio-telegraphic Committee (1907), and Dominions Royal Commission (1911). Member of R.F.C. (Air) Enquiry Committee (1916), and of British Association War and Engineering Committee (1916). Contributed papers, addresses and lectures to numerous learned societies. Author of various standard works, notably "Submarine Telegraphs," "The Story of the Atlantic Cable," "The Administration of Imperial Telegraphs" and "Telegraphy, Aeronautics and War." Represented Australia as sole delegate at the International Radiotelegraphic Conference (1912). Vice-President, Wireless Society of London and Institute of Aeronautical Engineers. Addresses: Leigh Grange, Tonbridge, and Athenæum Club, Pall Mall, London, S.W.1.

Brown, Frank James, C.B.E., M.A., B.Sc.—B. 1865 near York. Educ. privately. Grad. London University (Honours and Prizeman). Entered the Higher Division of the Civil Service, 1886. Appointed to the Post Office. Principal Clerk, 1910. Assistant Secretary in charge of Telegraphs, March, 1919. Member of British Peace Delegation, 1919, in capacity of expert adviser on telegraph questions. Post Office representative on Imperial Communications Committee, and Member of Wireless Telegraph Sub-Committee of that Committee. Member of Imperial Wireless Telegraphy Committee appointed by Government in 1919 to formulate a scheme of W/T for the Empire. Senior British Delegate to Conference at Washington on Telegraph Communications, 1920. Address: G.P.O., London.

Brown, Sidney George, F.R.S. M.I.E.E.—B. 1873, Chicago, U.S.A., of English parents, and brought to England when eighteen months old. Educ. Harrogate and London University. Made a special study of submarine telegraphy and is inventor of the magnifying cable relay. Invented the drum cable relay and the magnetic shunt, 1898. Since that date he has also devoted much attention to telephony and wireless telegraphy and has achieved some important results, such as the carbon telephone relay, telephone transmission on land trunk lines, the improved wireless telephone receiver, and other inventions. Vice-President of the Wireless Society of London.

Bucher, Elmer E.—B. Akron, Ohio, November 11th, 1885. Educ. Academy Oberlin, Ohio. Joined the De Forest Wireless Telegraph Company as experimental engineer, 1903. Constructed several high-power stations in the Middle West and on the Gulf Coast for this firm. Joined the United Wireless Telegraph Company as installation and experimental engineer, 1907. Installed the first ship stations of the United States Navy. Organised the United Wireless Telegraph Company's School, 1909. Instructing engineer and chief inspector of that company for more than two years. Associated himself with the Y.M.C.A., New York, in the initiation of wireless schools, 1910. Joined the Marconi Wireless Telegraph Company of America as instructing engineer, 1912. Organised Marconi Institute, 1917, and acted in capacity of Director. Joined Commercial Department, Radio Corporation of America, 1920. Devoted many years to experimental long-distance wireless work and holds a large number of U.S. wireless patents. Held position as Technical Editor of "Wireless Age" during the period 1913–18. Author of "Practical Wireless Telegraphy," "Vacuum Tubes in Wireless Communication," "Wireless Experimenters' Manual," and other works. Member of the Institute of Radio Engineers. During the year 1920 appointed Commercial Engineer of Radio Corporation of America and placed in charge of Foreign Government and Miscellaneous Radio Sales.

Bullard, Rear-Admiral W. H. G., U.S.N.—B. December 6th, 1866, State of Pennsylvania, U.S.A. Graduated, United States Naval Academy, 1886. Served on ships of the Navy on the Atlantic, South Atlantic, Pacific and Asiatic Stations, with shore duty, with particular reference to the science of Electrical Engineering, in which he had specialised. First Superintendent of the Naval Radio Service, 1912–16. Under his supervision the communication system of the Navy Department was developed and enlarged. Delegate-plenipotentiary of the United States at the International Conference for Safety of Life at Sea, London, November, 1913. In charge, on behalf of the United

States Navy, of the wireless operations contained in the series of experiments carried out between the Eiffel Tower and Arlington to determine longitude by means of wireless telegraphy. During the World War his sea service was in the Sixth Battle Squadron of the British Grand Fleet, serving in the North Sea. After the war he returned to Washington in charge of the Communication Service of the Navy Department, with the title "Director Naval Communications," the former Radio Service having been enlarged to include all forms of communication.

Burstyn, Dr. W.—B. Austria, 1877. Educ. Vienna University. Started his career as electrical engineer with the Siemens-Schuckert Werke, Charlottenburg. Later engineer with Gesellschaft fur Drahtlose Telegraphie. Developed together with Baron Lepel (1907–12) the quenched spark system. Proprietor of a Techno-Physical Laboratory. Now at Physics and Technical Laboratory and is *privatdocent* for wireless telegraphy and electric clinics, Technical High School, Charlottenburg. Address: Berlin—Wilmersdorf, Prinzregentenstrasse 23.

Carpentier, Jules.—Member of the Académie des Sciences, Bureau des Longitudes, Commander of the Legion of Honour, President of the Société de Publications Radiotechniques. B. Paris, 1851. Joined Ecole Polytechnique, 1871. Commenced work with the State Railways. In 1876 appointed Principal Stores Engineer of Lyons Railway Company. For his electrical work shown at the Electrical Exhibition of 1881, he obtained the Gold Medal and the Cross of Chevalier of the Legion of Honour. Later became President of several learned Societies. Entered the Bureau des Longitudes, 1897. Invented several pieces of mechanism for musical instruments and photographic apparatus. Inventor of a type of periscope for submarines. Interested himself from the beginning in radiotelegraphy. Founder of the Compagnie Générale Radiotélégraphique, which was later absorbed by the Compagnie Générale de Télegraphie sans Fil.

Chaffee, Professor E. L., Assistant Professor of Physics, Harvard University.—B. April 15th, 1885, Somerville, Mass. Educ. High School, Somerville, and Massachusetts Institute of Technology in Boston. Graduated B.S. in Electrical Engineering, 1907. Awarded the degree of M.A. in Physics, Harvard University, 1908, and Ph.D., 1911. Conducted courses in physics and radiotelegraphy at Harvard University. Engaged in research and consultation work in radiotelegraphy. Author of several papers, including "A New Method of Impact Excitation of Electric Oscillations and their Analysis by the Braun Tube Oscillograph," published 1911. During the war engaged in developing some radio apparatus, with which he experimented in France, 1918. Has published Physics Laboratory Manuals.

Chamberlain, Eugene Tyler.—Son of General Frank Chamberlain. B. in Albany, N.Y., September 28th, 1856. Educ. Albany Academy and Harvard College. Graduated with honours in Metaphysics, 1878. In business for two years, then took up journalism and acted as legislative and political correspondent to the Associated Press. Came to Washington, 1893. Appointed Commissioner of Navigation by President Cleveland. In 1903, on the creation of the Department of Commerce and Labour, he joined others in urging the importance of wireless telegraphy as a means of promoting safety of life on merchant vessels at sea, and he has since played a prominent part in promoting legislation on this subject. Delegate for the U.S.A. to the Convention on Safety of Life at Sea, at London, 1914. Address: Department of Commerce, Bureau Navigation, Washington, D.C.

Chevrelière, Jean Marie Charles Aymé, Baron de la.—B. Poitiers, France, 1858. Educ. in that city. Member of Parliament, Mayor and General Counsellor. After a course at the Military Academy of St. Cyr (1877–79), followed by specialised training at Saumur, remained for fifteen years in the active army as cavalry officer, retiring with the grade of captain in the Reserve, 1892. Member of Légion d'Honneur, Military class. Mobilised from August 2nd, 1914, to July 5th, 1917. Joined the Board of the Belgian "Société Anonyme de T.S.F.," 1901, and subsequently took a prominent part in the initiation of the "Compagnie Française Maritime et Coloniale de T.S.F.," now known as "Compagnie Industrielle de Mécanique et d'Electricité," of which he is President and Managing Director. From early 1914 to the end of January, 1918, occupied the post of managing director of the Cie Universelle de Télégraphie et de Téléphonie sans Fil, which on February 12th of the same year was merged in the Cie. Générale de T.S.F., of which he is vice-president. Director of "Société Française Radioélectrique" and "Compagnie d'Exploitation Radioélectrique." Also Director of "Cie. Radio France" and of "Cie. Sté. Franco Argentine." Address: 23, rue Dumont d'Urville, Paris.

Childs, H. B. T., A.F.R.Ae.S., A.M.I.E.E.—Chief of Field and Air Division, Marconi's Wireless Telegraph Co., Ltd. B. Llandilo, S. Wales, 1884. Educ. King's School, Canterbury; London University. Joined the Marconi Company, 1905. Served as Engineer in Russia, Canada, Spain, and Egypt. Joined Royal Flying Corps, autumn, 1915. Served in France, November, 1915, to August, 1917. Appointed to command W/T Experimental Establishment, R.A.F., August, 1917. Promoted Lieut.-Col., December, 1917. Appointed in charge of W/T for the R.A.F. in France, May, 1918, till April, 1919. Mentioned in dispatches, 1916, 1918. Address: Holdenhurst, Oatlands Avenue, Weybridge.

Chree, Charles.—Superintendent of Kew Observatory since 1893. Assistant Director of the Meteorological Office. B. 1860, Lintrathen, Forfarshire. Sc.D. of Cambridge, Hon. LL.D. (Aberdeen), F.R.S. Graduated M.A. Aberdeen (1879) with first-class honours in Mathematics and Natural Philosophy. At Cambridge, in 1883, was sixth wrangler, gaining also first-class honours in Mathematical and Natural Sciences Triposes. Fellow of King's College, Cambridge (1885); re-elected Research Fellow (1891). ex-President of Physical Society of London; member of the British Association Committee for Radiotelegraphic Investigation. Holds Watt Medal of Institution of Civil Engineers. Largely concerned with geophysics, especially terrestrial magnetism and atmospheric electricity. For his researches in the former subject received Hughes Medal from the Royal Society. Publications: "Studies in Terrestrial Magnetism," articles in "Encyclopædia Britannica." Address: 75, Church Road, Richmond, Surrey.

Cohen, Louis, Ph.D., Consulting Engineer.—B. 1876. Educ. at Armour Institute of Technology, University of Chicago, and Columbia University. On scientific staff of the Bureau

of Standards, 1905–09.! Chief of Research Department of the National Electric Signalling Co., 1910–12. Engaged in consulting practice since 1912. Professor of Electrical Engineering, George Washington University. Especially interested in the subject of electrical oscillations. Author of "Formulæ and Tables for the Calculation of Alternating Current Problems," and scientific and technical papers dealing with problems in wireless telegraphy and kindred subjects.

Coursey, Philip R., B.Sc. (Eng.), F.Inst P., A.M.I.E.E., M.R.I. Assistant Editor "The Radio Review."—B. 1892. Educ. University College, London. Awarded Diploma in Electrical Engineering with Distinction. Graduated with first-class Honours in Electrical Engineering at the University of London. Subsequently acted as Assistant to Dr. J. A. Fleming, F.R.S., in the Electrical Engineering Department and Research Laboratories of University College, London. From 1915–18 served as Inspector of Wireless Telegraph Apparatus for the Admiralty; afterwards appointed to the Staff of H.M. Signal School, Portsmouth, as Research Physicist. Sometime Research Electrical Engineer to the Dubilier Condenser Co. Author of papers on Radiotelegraphy and Telephony, read before a number of Societies, and of "Telephony without Wires." Address: 138, Muswell Hill Road, London, N.10.

Craioveanu, Eugen.—B. 1872. Secondary studies and graduated in Physics and Chemical Science in Roumania. Sent by Roumanian Post Office Department to study as Telegraph Engineer at Ecole Supérieure des Postes et Télégraphes, Paris, and Post und Telegraphen Hochschule, Berlin. Engineer in all branches of Telegraphy and Telephony, Roumanian Post Office. District Director, Chief of Telegraph Postal Service during Balkan War (1913), and also 1916 to 1917. Sub-Director-General of Roumanian Posts, Telegraphs and Telephones, January, 1920. Resigned August 1st, 1920. Engaged in research for modernising technical telegraphy and telephony. Director-General of Roumanian Marconi Company. Address: 4, Strada Saguna, Bucarest-Roumania.

Crawley, Lieut.-Col. C. G. G., Royal Marine Artillery (ret.), M.I.E.E., Deputy Inspector of Wireless Telegraphy, General Post Office. Employed at Wireless Telegraphy in the Navy, 1903 to 1913, as Experimental, Instructional, and Fleet Wireless Officer. Deputy Inspector of Wireless Telegraphy in the Post Office, 1913. Returned to the Naval Wireless service (1914) for the period of the war. During the war served in the Grand Fleet, in command of the R.N.V.R. Wireless School, at the Admiralty, and supervised the erection and working of various Naval stations abroad. Mentioned in Gazette for valuable services, and received letters of appreciation from the Admiralty. Officer of the Order of Aviz. Order of Liakat. R.H.S. testimonial for saving life. Resumed his duties in the Post Office, 1919. Address: General Post Office, London, E.C.

Cresswell, F. G., A.M.I.E.E.—Radio Commander in the Australian Navy during the war. Entered upon professional career, 1897, and received his training and experience with engineering firms in Australia. Entered Government service in the Electrical Engineer's Branch of the Postmaster-General's Department, Melbourne. Commissioned in the Naval Forces of the Commonwealth as Engineer Sub-Lieutenant detailed for electrical duties, 1907. Served in the Royal Australian Navy from the time of its inauguration. Appointed Fleet Wireless Telegraph Officer, 1912, rising to the rank of Radio Commander and Acting Director of the Radio Service, July, 1916. On his return from naval operations in the Pacific during the early stages of the late war, was selected to take over the control, under the Naval Board, of the Wireless Telegraphy Department of the Commonwealth, which had been transferred by Act of Parliament to the control of the Royal Australian Navy. His first work was that of organising the Commonwealth Radio Service on naval lines and under naval discipline. Assisted at the capture of the German high-power wireless stations at Samoa, Nauvu, and Rabaul, being mentioned in despatches. Member of the Institute of Engineers, Australia. Appointed Electrical Lieut.-Commander Royal Australian Navy since the transfer of the Commonwealth Radio Service back to the Postmaster-General's Department and the disbandment of the Royal Australian Naval Radio Service. Director of Signal Division Naval Staff. Address: Navy Office, Melbourne.

Cross, Professor Charles R.—B. at Troy, New York, March 29th, 1848. Returned with his father to Newbray Port, Massachusetts, 1862. Graduated at the Putnam Free School in that city, 1865, and engaged temporarily in teaching. Graduated at Massachusetts Institute of Technology, 1870. Appointed instructor in Physics. Became a Junior Professor in Physics, 1875. Placed in charge of the Dept. of Physics, 1877, and later Thayer Professor of Physics and Director of the Rogen Laboratory of Physics. Became interested in the industrial applications of electricity. Lectured upon this subject, 1881. Retired from active teaching, 1918, and made Professor Emeritus. Author of papers embodying the results of researches upon electric and acoustic subjects. Has delivered many public lectures, a number of which were before the Lowell Institute of Boston. Acted as expert for the American Bell Telephone Company throughout the extended litigation concerning the Bell patents, as well as in other telephone cases. Expert for the American Marconi Company in the suits which resulted in the establishment of its fundamental patents. Fellow of the American Academy of Arts and Sciences. Chairman of the Rumford Committee of that institution for twenty-two years. President of the Elizabeth Thompson Science Fund, a member of the American Association for the Advancement of Science, the British Association for the Advancement of Science, and of the American Institute of Electrical Engineers, of which he was one of the original vice-presidents. Past Chairman of one of the three Lectures of the Electrical Congress at the World's Columbian Exhibition at Chicago, 1893.

De Forest, Dr. Lee.—B. Council Bluffs, Iowa, August 26th, 1873. Graduated Ph.D., 1899. Founded the De Forest Wireless Telegraph Co., 1902, the Radio Telephone Co., and the De Forest Radio Telephone Co., 1907. Awarded gold medal for radiotelegraphic work, St. Louis Exhibition, 1904. He distinguished himself in the American-Spanish War, 1898. Member of the Institute of Electrical Engineers of the Franklin Institute, and of the Institute of Radio Engineers.

De Groot, Doctor Engineer Cornelis Johannes, Chief of the Radiotelegraphic Service in the Dutch East Indies.—B. at Den Helder, January 27th, 1883. Educ. as Mechanical Engineer at Technical High School, Delft, and afterwards at Karlsruhe, where he obtained the diploma of

Electrical Engineer. During 1915-16 took degree as Doctor in Technical Sciences at Delft University. Spent eighteen months in the service of the G.E.C. of Berlin and thence transferred himself to the Dutch East Indian Government, superintending the erection of various wireless stations in the Indian Archipelago. In 1915-16 visited Europe on furlough and took Doctor's degree on the thesis of "Radio-telegraphy in the Tropics," a notable production which obtained him much *kudos* when subsequently published. A supplementary dissertation upholding the advisability and technical possibility of establishing direct radio communication between Holland and its Colonies won him the honour of having his Doctor's degree conferred *cum laude*, and he was subsequently instructed to carry into practical effect the measures he advocated in that essay. His initial experiments in establishing such communications met with success. Has made many contributions to radio literature, one of the best known being a monograph on "The Nature and Elimination of Strays," originally read before the Institute of Radio Engineers, New York.

Desbarats, George Joseph, C.M.G., B.Sc. Deputy Minister and Comptroller of the Canadian Naval Service, since June, 1910.—B. Quebec, January 27th, 1861. Educ. Public Schools; Terrebonne College, Ecole Polytechnique, Montreal (honours and gold medal, 1879); Laval University (B.A.Sc., 1901). Engineer on construction of canals and other public works: assistant to late John Page, Chief Engineer of Canals; Inspector, Railway Construction, B.C., 1892-96; Engineer of Construction, Galops Canal, 1896-99; employed in hydraulic survey work, St. Lawrence River, three years; rebuilt and enlarged the Government shipyard, Sorel, Quebec, 1901; Acting Deputy Minister of Marine and Fisheries, Ottawa, 1908-09; Deputy Minister, 1909-10; Plenipotentiary for Canada at the Radiotelegraph Conference held at London, England, 1912. Member of the Canadian Society Civil Engineers, 1897; Councillor, 1907; Vice-President, 1909; Councillor, Ecole Polytechnique, 1909; Plenipotentiary for Canada to International Seaman's Conference, Genoa, 1920. Address: Ottawa, Canada.

Destruge, Guillermo, Director General of Telegraphs, Telephones and Wireless, Ecuador, February, 1898, to February, 1906, and from March, 1912, in which capacity he is still serving. Established duplex telegraphic system and telephones in Quito, the capital, 1900. The installation of wireless telegraphy in Ecuador has been instituted under his direction. President of the Radiotelegraphic Commission of the Republic. The personnel of the Telegraphic and Telephonic service of Ecuador presented to him on August 10th, 1920, as an appreciation of his good work, an artistic and valuable inscribed gold tablet. Author of several scientific publications. Address: Apartado No. 59, Quito, Ecuador, South America.

De Valbreuze, R.—One of the first promoters of the use of undamped waves. Presented (1902) an important memorandum to the French Ministry of War on this subject. Attached as Officer of Engineers to the Central Establishment of Military Telegraph *Matériel*. In this capacity studied means for producing undamped waves by means of mercury arcs. Left Army for industry. Published (1906) a work on wireless telegraphy. During the war was a Captain of Engineers attached to the Radiotelegraphic Centre in Paris. Sometime Vice-President of the Société Internationale des Electriciens. Director of several Technical Societies. Chevalier of the Legion of Honour.

De Vasconcellos e Sa, Dr. Alexandre, State Secretary of the Portuguese Colonies.—B. November 28th, 1872. Graduated as a Doctor of Medicine in the Medical School at Lisbon. Joined the Portuguese Navy, 1894, where he gained a reputation as a physician and surgeon. After the proclamation of the Portuguese Republic in 1910 interested himself in politics, and as a member of Parliament specialised in Colonial subjects. Served in the Barué Campaign, 1912. Chief Health Officer to the expedition sent to Cuamato when the Germans invaded Portuguese territory, 1913-15. His services won him the highest military distinction granted by the Portuguese Navy. On returning from the expedition to Angola was appointed Commissioner of the Portuguese Government to the Mozambique Company. Secretary of State to the Colonies, May 14th, 1918. In this capacity devoted considerable attention to the development of radiotelegraphy in the Portuguese colonies.

Dowsett, H. M., M.I.E.E., F.Inst.P.—Born in London, February, 1879. Educated at the Central Foundation School, London; École Internationale, Paris. Trained as an electrical engineer at Finsbury Technical College under Professors S. P. Thompson and John Perry. His early practical experience was obtained with the British Thomson-Houston Co., Bankside, at the St. Pancras Electricity Supply Station, King's Road, and with S. Z. de Ferranti, Ltd., Charterhouse Square. In April, 1899, he joined the engineering staff of the Wireless Telegraph & Signal Co., now known as the Marconi's Wireless Telegraph Co., Ltd. He was associated with much of the early developmental work of this company, and after having erected stations and demonstrated wireless telegraphy ashore and afloat for commercial and war purposes in all parts of the world, was appointed in charge of the test rooms and drawing office at the Hall Street works, Chelmsford, in August, 1908. In 1912 he was responsible for the layout and equipment of the testing laboratories of the New Street works, which was opened in June of that year, and has held the position of chief of the testing department from that date to the present time. He revised the "Handbook for Wireless Telegraphists," of J. C. Hawkhead, for the second edition published in 1915, and is the author of "Wireless Telegraphy and Telephony: First Principles, Present Practice and Testing," published in 1920. His recent paper on "Carborundum and its Rectification Effect," which appeared in the *Radio Review* for November and December, 1921, brings forward evidence that rectification effect is a property of crystal structure. Address: Marconi Works, Chelmsford, Essex.

Dubilier, William.—B. July 25th, 1888, in the U.S.A. Consulting radio engineer and inventor. Devoted much attention to wireless telegraph, telephone, and high-frequency experiments. Since 1904 consulting radio engineer. Principal of the Dubilier Electrical Syndicate, Ltd., London, England, and of the Dubilier Condenser Co., Inc., New York. Inventor of the Dubilier Mica Condenser. Obtained over 150 patents and applications for wireless apparatus. Address: Aero Club, New York.

Eccles, W. H., D.Sc., A.R.C.S., M.I.E.E., F.R.S.,—Dean of the City and Guilds of London Technical College, Finsbury, E.C., and Professor of Applied Physics and Electrical Engineering.

Vice-President of the Institution of Electrical Engineers, of the Physical Society, and of the Institute of Physics; First Chairman of the Wireless Section of the Institution of Electrical Engineers; Honorary Secretary of the British Association Committee for Radiotelegraphic Investigation.—B. Furness, Lancs, 1875. Entered the Royal College of Science, South Kensington, in 1894. Three years later was appointed demonstrator in the Physics Laboratory at the College, and in 1898 graduated at the London University with first-class honours in Physics. In 1899 he entered Mr. Marconi's laboratory at Chelmsford and spent a great part of his time in the investigation of electrical oscillations of air wires and in "jiggers." Devised a laboratory method for testing and classifying coherers, and results of a later study of coherers were presented as one of his D.Sc. theses. In 1901 was appointed Head of the department of mathematics and physics at the South-Western Polytechnic, Chelsea, and afterwards University Reader in Graphics at University College, London. Address: 2, Ryder Street, St. James's, S.W.1.

Eichhorn, Gustav, Ph.D.—B. Düsseldorf (Germany), December 1st, 1867. Studied physics. After the sudden death of his father became managing director of the paternal paper-mills for ten years. Returned to the profession of his choice and continued his interrupted studies. After three years at Berlin, Munich, and Zürich, took the degree (Phil. Dr.) at the last-named University. Entered the wireless telegraph laboratory of Prof. Braun, at Siemens and Halske, in Berlin. Appointed manager of their experimental stations on the Baltic, where for about eighteen months he conducted a number of investigations. Publications: Drahtlose Telegraphie (Leipzig, 1904), Wireless Telegraphy (London, 1906). Collaborator of various technical journals. Inventor of the buzzer-device which is used in connection with wave-meters and other instruments in the nature of oscillators. Returned to Zurich, 1905, and launched the *Jahrbuch der drahtlosen Telegraphie und Telephonie*, 1907. Engaged in practical and theoretical work in wireless telegraphy and telephony. Address: Hauptpostfach 6123, Zurich, Switzerland.

Eisenstein, S. M.—B. Kief, Russia. Educ. Kief University. Studied at the University of Berlin and the Charlottenburg Polytechnic. First turned his attention to wireless telegraphy, 1900. Obtained his preliminary wireless patent and established a private experimental laboratory, 1904. General Soukomlinoff, then commanding the troops of the Kief Division, heard of the young wireless enthusiast and encouraged him to carry out experiments on a large scale, eventually prevailing on the Russian War Office to provide the young scientist with sites for the erection of stations. The action, taken in consequence by the War Office, resulted in the realisation of the necessity for forming a wireless company; the project speedily materialised and Mr. Eisenstein changed his headquarters from Kief to Petrograd. The new departure speedily justified itself, and in 1911 the original company coalesced with the Marconi Company, and the reconstructed Russian Organisation, with Mr. Eisenstein as Director and Principal Technical Adviser, assumed responsibility for the development of Russian wireless.

Erskine-Murray, James, D.Sc., F.R.S.E., F.I.P., M.I.E.E., F.I.Radio E.—B. Edinburgh, October 24th, 1868. After six years' study and research under the late Lord Kelvin at Glasgow University entered Trinity College, Cambridge, as a research student. Assistant Professor of Physics and Electrical Engineering in the Heriot-Watt College, Edinburgh, 1896–98. Appointed experimental assistant to Mr. Marconi, 1898. Lecturer and Demonstrator in Physics and Electrical Engineering at University College, Nottingham, 1900. Lecturer in Electrical Engineering at the George Coates Technical College, Paisley, 1905. Consulting work in radiotelegraphy, 1905. Lecturer on Radiotelegraphy at the Northampton Institute, London, 1907–11. Contributed papers to numerous learned societies. Author of several works on wireless telegraphy. Partner in the firm of Clark, Forde, Taylor, and Erskine-Murray, consulting engineers, 1913–18. Joined the Royal Naval Volunteer Reserve, 1917, with rank of Lieut.-Commander. Now serving with the Royal Air Force in charge of the design of wireless instruments and of experimental work. Elected President of Wireless Society of London, 1921. Address: 16, Elmfield Road, Bromley, Kent; Telephone, Bromley 858; Club, Caledonian.

Ewen, Harry Alexander.—B. Aberdeen, December 17th, 1877. Educ. Aberdeen Grammar School; Liverpool Institute. Received Engineering training at Heriott-Watt College. Medallist in Elec. Eng. and Elec. Eng. Hons., 1901–02. Joined Engineering Staff of Marconi's W/T Co., 1902. Appointed Wireless Telegraph Expert to the Brazilian Navy, 1910; later rejoined Marconi's W/T Co., and appointed Chief of Drawing and Design Dept. Address: "Braeside," Priest Lane, Shenfield, Essex.

Faber, R. N. A., Lieutenant-Colonel, Royal Danish Engineers.—Born in Copenhagen, April 29th, 1869.—Chief of Military Wireless Service of Denmark. Delegate to the International Radiotelegrafic Congress of Berlin, 1906, and London, 1912. Member of the Military Telegraph and Telephone Commission and of the Government Radiotelegraph Commission. Knight of the Order of Dannebrog, etc. Permanent address: Ingeniorkasernen, Copenhagen.

Farrand, C. L.—B. Newark, N.J., October 22nd, 1891. Educ. Central High School, Philadelphia, Pa. Wireless operator and instructor, 1909–13. Inspector of construction work, 1913, testing and designing of coastal stations. Assistant to Mr. H. Shoemaker, the research engineer of the Marconi Laboratory, Aldene, N.J. Engineer-designer in Aldene, N.J., 1917, especially devoting his attention to radiotelegraphic research and design. His research work has been particularly associated with the De Forest Valve litigation, the development of valves, and the elimination of static. His activities have been mainly exercised in connection with the design of commercial and naval quenched spark apparatus, regenerative valve receivers and regenerative valve transmitters, both telephonic and telegraphic.

Ferrié, General Gustave, Technical Director of French Military Radiotelegraphy. Officer of the Legion of Honour, D.Sc. of the University of Oxford, Companion of St. Michael and St. George, Commander of the Crown of Italy, Officer of the White Eagle of Serbia, Holder of the Distinguished Service Medal of the United States, Commander of the Double Dragon of China, Officer of La Couronne, etc.—B. at St. Michel de Maurienne (Savoy), November 19th, 1868. His connection with wireless telegraphy started February, 1899, when he was present during experiments of Senatore Marconi between Wimereaux and Dover. Initiated French Military

Radiotelegraphic Service in 1900. Was member of French Delegation to the International Electrical Congress of St. Louis in 1904. Member of the French Delegation to the International Radiotelegraphic Conference of London (1912). Appointed General Secretary of the International Time Conference, Paris (1913). He has, in the course of a brilliant career, written a large number of monographs and periodic contributions dealing with radiotelegraphy and kindred subjects, both from a technical and organisation point of view. Address: Inspecteur Générale de la Telegraphie, 51 bis, Bd Latour Maubourg, Paris.

Fessenden, Reginald Aubrey.—B. Milton, Canada, October 6th, 1866. Educ. New York and Port Hope, Ontario. Inspecting engineer to the Edison Company, New York. Took up teaching work and conducted classes in physics and electrical engineering at Western University, 1892. Professor of Electrical Engineering at Western University, Philadelphia, 1893. Special Agent to the U.S. Weather Bureau, 1900. Has devoted much attention to the development of a system of wireless telegraphy known by his name, and has also carried out important experiments in wireless telephony. Contributor of articles on wireless telegraphy and telephony to many technical journals.

Field, Rear-Admiral F. L., C.B., C.M.G., 3rd Sea Lord and Controller of the Navy; Member of Committee (appointed November, 1919) to advise British Government on Imperial W/T Communications.—B. April 19th, 1871. Entered Royal Navy, July, 1884; promoted Lieut., 1893; qualified as Torpedo Lieut., 1896. Landed in expedition for Relief of Legations at Pekin from H.M.S. "Barfleur," 1900. Mentioned in despatches; wounded at taking of Tientsin Native City. Promoted Commander, 1902; Captain, 1907; Commanded H.M.S. "Duncan," 1910; Superintendent of Signal Schools, 1912; Capt. H.M.S. "Vernon" (Torpedo School), 1914; Capt. H.M.S. "King George V" at Battle of Jutland; mentioned in despatches, awarded C.B. (Military division). Chief of Staff to Admiral Second-in-Command Grand Fleet, 1916. Awarded C.M.G. for this service. Director of Torpedoes and Mining at Admiralty, 1918. Promoted Rear-Admiral, February 11th, 1919. Appointed 3rd Sea Lord and Controller, April 15th, 1920. Address: Admiralty, Whitehall, London, S.W.1.

Fisk, Ernest Thomas, M.I.Radio E.—B. Sunbury-on-Thames, August 8th, 1886. Educ. Primary and High Schools. Studied physics, mathematics, and commercial subjects. After two years with Messrs. Frederick Walton and Co., he entered the British Telegraph Service. Joined the Marconi Company in England (1905). Temporarily engaged in engineering branch of the American Marconi Company, erecting stations on ship and shore. Undertook a special mission to the Arctic icefields, 1909, and demonstrated the possibilities of wireless communication with Newfoundland Sealing Fleet. Visited the Antipodes, 1910, in R.M.S. "Otranto," and demonstrated the use of the Marconi apparatus for the Orient Mail Line of steamers. Again visited Australia, 1911. General Manager with a seat on the board of directors of Amalgamated Wireless (Australasia), Limited, 1913. Revisited England, 1916. Shortly after return to Australia, accepted position as Managing Director of the Company. Tested possibility of direct wireless communication between England and Australia. Gave the first public demonstration of wireless telephony in Australia before the Royal Society of New South Wales. Reorganised manufacturing work. Managing Director of the Australectric Company, now Australectric Limited. Founder and initiator of "Sea, Land, and Air," the first journal in the Southern Hemisphere to deal with aviation and wireless. Established the Australasian branch of The Wireless Press. Member of the Electrical Association of Australia, President of the Wireless Institute of Australia (New South Wales Section), Member of the Sydney Chamber of Commerce and the Chamber of Manufacturers, Member of the Executive Committee, Australasian Industries Protection League, Member Provisional Committee appointed to consider the formation of the Chamber of Science and extending application of science to industry. Chairman Section of Industry, Royal Society of N.S.W., 1920–21.

Fleming, John Ambrose, D.Sc., M.A., F.R.S., University Professor of Electrical Engineering, University of London (1912).—B. Lancaster, November 29th, 1849. Educ. University College School, London; University College; R. School of Mines. Sometime Fellow of St. John's College, Cambridge; Fellow and Hughes Gold Medallist, Royal Society. Lecturer in mechanics and applied science, Cambridge University (1880). First Professor of Mathematics and Physics (1881), University College, Nottingham. First occupant of Pender Chair of Electrical Engineering, University College, London (1885); Vice-President of Wireless Society of London. Sometime Vice-President of Institution of Electrical Engineers and Physical Society. Honorary Member of the Royal Engineers' Institute, Chatham. Scientific Adviser to the Edison and Swan United Electric Light Company, 1882–93. Scientific Adviser to the London Electric Supply Corporation, and many other corporations, firms and companies in electrical matters. Publications: Numerous contributions to scientific literature and research. Author of well-known text-books, particularly on wireless telegraphy. Twice awarded Institution Premium of Institution of Electrical Engineers; also silver medal of Royal Society of Arts, and Bernay's Premium of the Society of Engineers. Awarded the Gold Albert Medal of the Royal Society of Arts in 1921 for his electrical researches and inventions. Widely known as inventor of the Thermionic Valve or Fleming Valve, the judicial decisions on which have declared it to be a pioneer invention of unusual utility, and one that has enormously aided the development of wireless telegraphy. Address: The Pender Electrical Laboratory, University College, Gower Street, London, W.C.1.

Forberg, Olaf E., Director of Telegraphs, Iceland.—B. November 22nd, 1871, in the Province of Finmark, Norway. Early attached to the Norwegian Telegraphic Service, first as a Telegraphic Clerk, later as the head of a station; Manager of the Controlling Station, Veblungsnes, in the Romsdal, 1900. Erected several new telegraphic plants in Norway, 1893–1904. Went to Iceland on an inspection, 1905, and in 1906 he constructed the telegraphic line from Reykjavik to Seydisfiord. Superintended the erection of stations and organisation of the telegraphic system in Iceland. Director of Telegraphs in Iceland, 1907, and controls both the wired and wireless nexus of the island. Member of the Engineers' Association of Iceland. Knight of Dannebrog, 1907. Address: Director of Telegraphs, Reykjavik, Iceland.

Fortescue, Cecil L., Professor of Physics, Royal Naval College, Greenwich, since January, 1911.—B. January 15th, 1881. Educ. Oundle

School and Christ's College, Cambridge, First-class Honours, Mechanical Sciences Tripos, 1903. Engineering training with Messrs. Siemens Dynamo Co., Stafford, 1903-06. Civilian Instructor in Applied Mechanics and Electro-Technics at H.M. Gunnery and Torpedo Schools, Portsmouth, October, 1906. During the war attached to Wireless Telegraphy Department, H.M.S. "Vernon," and at H.M. Signal School, Portsmouth. Member of Institution of Electrical Engineers, serving on Committee of Wireless Section of that Institution. Fellow of the Institute of Physics. Member of the Physical Society of London, serving on the Council. Member of Sub-Committee "D" on Thermionic Valves of Radio Research Board, of the Department of Scientific and Industrial Research. Address: Royal Naval College, Greenwich, S.E.10.

Franklin, Charles Samuel.—B. 1879. Received engineering and scientific training at Finsbury Technical College, under Professor Sylvanus Thompson. After some time spent in electrical work, first at Manchester and afterwards with the Norwich Electricity Company, joined Marconi's Wireless Telegraph Company (then known as the "Wireless Telegraph and Signal Company"), 1899, and still remains in their service. He has during recent years been engaged in conducting experimental and research work on behalf of Senatore Marconi, and has a number of important patents to his credit.

Frey, Emile, Swiss politician.—B. 1838, Arlesheim. Visited United States, and took part in American Civil War (1861-1865), serving with the Northern (or Federal) Army. Returned to Switzerland, 1865. Member of the National Council, 1872-1882, of which he was Chairman from 1875 to 1876. Swiss Minister Plenipotentiary at Washington, 1882-88. Member of the Federal Council, 1890, Vice-President, 1893. President of Swiss Confederation, 1894. Resigned from the Federal Council, 1897. Director of the International Bureau of the Telegraph Union from 1897, and of the Radiotelegraphic Union since 1910 until 1921. Address: Col. Frey, Arlesheim, near Basel.

Frouin, M.—Director of French Telegraphs, one of his country's representatives at the International Radiotelegraphic Conference, London, 1912.

Gardiner, B. C.—B. February 25th, 1879. Son of Rev. Canon W. Gardiner, B.D., of St. Albans Priory, Wallingford. Educ. at Marlborough College, Member of Institute of Electrical Engineers (M.I.E.E.), Brevet Lieut.-Colonel, Companion of the Order of the Bath (C.B.). Joined Royal Marines 1897. Supervised the erection of Bermuda Wireless Station 1907. Senior Instructor of Wireless Telegraphy at the Royal Naval Electrical School, H.M.S. Vernon, 1910. Attached R.E. as the Instructor of Wireless Telegraphy at the Army School of Military Engineering, Chatham, 1913. Wireless officer on the staff of Lord Jellicoe 1914-1916. Fleet wireless officer on the staff of Earl Beatty 1916-1918. Head of the Wireless Telegraphy Board 1920. Admiralty representative at the Allied Conference on Electrical Communications at Washington 1920 and at Paris 1921. Address: 24a, West Cromwell Road, S.W.5.

Gentil, Captain Antonio Alves Soares Branco, Member of Technical Committee of Portuguese Naval Wireless Telegraphy.—B. March 7th, 1874. Educ. at the Polytechnic and Naval Schools. Between 1893 and 1909 filled various Naval posts in Angola and Mozambique. Qualified as Torpedo Operating Officer at the Torpedoes and Electricity School of Val de Zebro in 1909; appointed Instructor of Wireless Telegraphy at the same school in 1911. Qualified as Submarine Commander in 1915. In 1916 became member of the Technical Committee of Naval Wireless Telegraphy appointed to investigate and make recommendations concerning wireless in all Portuguese Colonies. Appointed the Naval Staff, August, 1918. Address: Majoria General d'Armada-Estado Maior Naval, Lisbon.

Girardeau, Emile, Managing Director, Société Française Radio-Electrique and Cie Gle de Télégraphie sans Fil. Director of the Cie d'Exploitation Radio-Electrique and the Cie Radio France.—B. 1882. Educ. Ecole Polytechnique. Joined the Army and served as an officer in the Engineers. Author of various works on a number of subjects relating to wireless telegraphy. Played an important part in the creation and organisation of the Société Française Radio-Electrique, of which he is the founder. He is a Member of Légion d'Honneur.

Glazebrook, Sir Richard Tetley, Kt., K.C.B., M.A., D.Sc., F.R.S.—B. Liverpool, Sept. 18th, 1854. Educ. Trinity College, Cambridge. Fifth Wrangler. Studied Physics as Graduate at the Cavendish Laboratory, Cambridge, under Clerk Maxwell and Lord Rayleigh. Fellow of Trinity College, Cambridge (1877). Principal of University College, Liverpool (1898–99). First Director of the National Physical Laboratory (1899–1919). Chairman of the Aeronautical Research Committee. Zaharoff Professor of Aviation and Director of the School of Aeronautics, Imperial College. Past President of the Institute of Electrical Engineers. Medal of the Royal Society of Arts (1918). Member of Technical Committee inquiring into Imperial Wireless scheme. Publications: Numerous works on Physical Optics, Laws and Properties of Matter, text-books on Heat, Light, Mechanics and Electricity, as well as numerous papers in Scientific and Technical Journals. Address: Coton End, 63, Grange Road, Cambridge.

Gold, Lieut.-Col. E., D.S.O., F.R.S., Assistant Director of Meteorological Office; President International Commission for Weather Telegraphy.—B. Berkswell, Warwickshire, July, 1881. Educ. King Henry VIII's Grammar School, Coleshill; Sir Josiah Mason's College, Birmingham; St. John's College, Cambridge. (Third Wrangler, 1903.) Part II Natural Science Tripos, 1904. Lecturer in Mathematics, City of London College, Moorfields, 1904; Fellow St. John's College, Cambridge, 1906; Superintendent, Instruments Division, Meteorological Office, 1906; First Schuster Reader in Dynamical Meteorology (1907); Superintendent of Statistics, Meteorological Office (1910). Gazetted Capt., June, 1915, and attached G.H.Q. as Meteorologist to R.F.C. D.S.O. for services in Battle of Loos, and promoted Major. Appointed to command of new Meteorological Section, R.E. Mentioned in dispatches five times; promoted Lieut.-Col., March, 1918. Represented British meteorology in Aeronautical Convention at Peace Conference, 1919. Research: Identification of negative "ions" in flames with "electrons" (1905); relation between barometric pressure and wind velocity (1906); atmospheric radiation (1907). Publications: Report on existing state of knowledge of upper atmosphere (read British Association, 1909); "International Kite and Balloon Ascents" (1911). Address: 8, Hurst Close, Bigwood Road, London, N.W. 11. Tel. Finchley 1209.

Goldschmidt, Professor Dr. Rudolf.—B. March 19th, 1876, at Neu-Bukow, Mecklenburg, Germany. Educ. Wismar Municipal School. Studied engineering at Charlottenburg and Darmstadt Technical High School. Engineer in the laboratory of the A.E.G. in Berlin, 1900. Chief laboratory engineer and designer in Prague, 1901–02. Chief engineer and designer at Cromptons and Co., Ltd., Chelmsford, 1902–05; similar position with Brit. Westinghouse El. and Man. Co., Manchester, 1905–07. Lecturer at Darmstadt Technical College, 1907. Here he practised as a consulting engineer, and also pursued the development of several inventions, chiefly occupying himself with the invention and design of high-frequency alternators for wireless telegraphy. Established (1911) two large wireless stations at Eilvese, Province of Hanover, and Tuckerton, New Jersey, U.S.A., for wireless communication between Germany and America. Address: Berlin-Westend, 45, Lindenallee, Berlin.

Goldsmith, Prof. Alfred N., B.Sc., Ph.D.—B. New York City. Graduated from the College of the City of New York and Columbia University. Author of "Elements of Physics," "The Transmission of Canal Rays through Thin Partitions," "Radio Engineering at the College of the City of New York," "The Engineering Measurements of Radiotelegraphy," "Radiotelephony," and other works. Research worker in radio communication, and particularly in radiotelephony. Director of Radio Engineering Laboratory at the College of the City of New York. Editor of the "Proceedings of the Institute of Radio Engineers," Chairman of the Standardisation Committee of the Institute of Radio Engineers (1915), Secretary of the Institute (1918–20), and Member of Board of Direction of the Institute. Fellow of the Institute of Radio Engineers, Fellow of the American Institute of Electrical Engineers, Member of the American Physical Society. During 1917–18 Technical Director of the U.S. Signal Corps School of Radio and Multiplex Telegraphy, New York, besides being associated with the U.S. Naval Radio Compass School. Director of the Research Department of the Radio Corporation of America, and for the Pan-American Wireless Telegraph and Telephone Co. Address: The College of the City of New York.

Gottwaldt, Commander B. L., late Inspector of W/T, Norwegian Navy Department. Manager, Norwegian Wireless Company (Norsk Marconikompani).—B. Christiania, 1880, entered Naval Academy, Norwegian Navy, 1898. Graduated sub-lieutenant, 1901. Attended the Military Academy of the Royal Navy, 1901–04, afterwards the Technical College, Charlottenburg, Berlin. At the latter studied electrical engineering, telegraphy, telephony, and wireless telegraphy. Visited (1906) England on behalf of the Norwegian Admiralty to attend to some special work with Messrs. Armstrong, Whitworth Co., Newcastle-on-Tyne. Returned to Norway and placed in charge of W/T in the Royal Norwegian Navy, where he was responsible for the erection of naval, land and ship stations. Appointed Commander, 1912. Entrusted with the control and test of wireless apparatus ordered in England and Germany by the Norwegian Government. One of the Norwegian delegates at the International Radio Conference in London, 1912. He has written a number of articles, and three books on wireless. Address: 15, Baldersgate, Kristiania.

Gray, Andrew, A.G.T.C., Assoc. M.Inst.C.E., M.I.E.E., Chief Engineer of the Marconi Parent Company (since 1910).—B. Glasgow, 1873. Educ. Glasgow University; Royal Technical College. Diploma of latter in electrical engineering. Served as assistant to late Professor Andrew Jamieson, of Royal Technical College. Joined the West India and Panama Telegraph Company, Ltd. (1893), serving respectively as assistant electrician, chief electrician, and telegraph engineer. Entered Marconi Company, 1899. Introduced Marconi system to Hawaiian Islands. Organised telegraph working and training of native operators of Inter-island Telegraph Company of Honolulu. Appointed Chief of Staff to the Marconi Companies in 1901, and in that capacity organised the working of the ship and shore wireless service, designed the original 1½ kw. Ship Set, and supervised the ship and shore operating until 1906, when the engineering and traffic work were separated. Address: 78, Creffield Road, Acton, W.3..

Grenfell, Wing Commander George Pascoe, D.S.O. (1917).—B. 1883. Educ. privately. Successively on staffs of Eastern Telegraph Co., Ltd.; Amalgamated Radio Telegraph Co., Ltd. (De Forest & Poulsen Systems): British Radio Telegraph Co., Ltd. Went overseas 1915 in charge of Wireless in R.F.C., Middle East. Served in Egypt, Senussi campaign, and Salonika. Transferred to H.Q. Staff—R.F.C., B.E.F., France, end of 1916. In charge of W/T (Communications and Artillery Co-operation). Mentioned in dispatches, 1917. Returned to England and joined Staff of Director of Air Organisation, Air Ministry, as S.O. 1, June, 1918. Appointed member of W/T Board, June, 1918. Took command of W/T Experimental Establishment, Biggin Hill, December, 1918. Address: R.A.F., Biggin Hill, Kent.

Hammond, John Hays, Jr.—B. San Francisco, April 13th, 1888. Educ. Preparatory Schools in England and the U.S. Graduated from the Yale-Sheffield Scientific School, 1910. Working ever since on the development of the system of radio control of torpedoes and other moving bodies. Originator of the system of aerocoastal patrol, comprising aeroplanes equipped with wireless, which received the endorsement of President Wilson, the Secretary of Navy, and the Secretary of War. Author of a four-volume treatise on the Art of Teledynamics. Treasurer of the Institute of Radio Engineers, and Manager and Chairman of the Committee on Admissions. Associate Member of the American Society of Mechanical Engineers. Delegate to the London International Radio Telegraphic Conference, 1912. Member of the American Institute of Electrical Engineers. Received honorary degree of Doctor of Science at George Washington University, June, 1919. Invented system of aerial radio surveying and mapping, which has been adopted by the Bartlett Expedition for Polar Basin surveying. Inventor of thermite incendiary shell, testing by Bureau of Ordnance, War Department. Inventor of the Radiodynamic Torpedo, testing by U.S. War Department. Address: Hammond Radio Research Laboratory, Gloucester, Mass.

Harrison, Lieut.-Col. Norman, C.M.G., D.S.O., M.I.E.E.—B. 1873. Educ. in Natal. Served in South African War, and European War, 1914–19, as Director of Army Signals in German South-West Africa, and as Assistant Director of Army Signals, and Commanding South African Signal Units (attached to Corps of Royal Engineers) in France, 1916–19. Engineer-in-Chief of Posts and Telegraphs, Union of South Africa since 1910. Addresses: (1) G.P.O., Pretoria; (2) Pretoria Club, Pretoria; (3) Civil Service Club, Capetown.

Hogan, John V. L.—B. Philadelphia, Pa., U.S.A. Educ. Scientific School of Yale University, specialising in physics and mathematics. Assisted Dr. Lee De Forest in his work on experimental Radiotelephony, and in the development of the grid audion, 1906 and 1907. Joined the staff of the National Electric Signalling Company at Brant Rock, Mass., 1909. Appointed Chief Research Engineer of that Company, 1914. In 1917 the Company changed its name to the "International Radio Telegraph Co.," and in 1918 he was appointed manager. Author of "The Heterodyne Receiving System," "Wireless Telegraphy in Railroad Service," "Transatlantic Radiotelegraphy," and numerous other articles and papers published in the Proceedings of the Institute of Radio Engineers, the "Electrician" (London), the "Electrical World," the "Jahrbuch der D.T.U.T.," etc. Fellow of the Institute of Radio Engineers, and Vice-President since 1916. Member of the American Association for the Advancement of Science, of the American Institute of Electrical Engineers, and honorary member of the Radio Club of America. Chairman of the Standardisation Committee of the Institute of Radio Engineers since 1916. He is the holder of a number of patents embodying inventions relating to radiotelegraphy, and has been identified with important patent litigation as principal technical witness. Address: C/o International Radio Telegraph Co., 326, Broadway, New York, U.S.A.

Holmstroem, J. Gunnar, Director of Radiotelegraphic Instruction, Stockholm, Kt. of "Vasa" Order.—B. Stockholm, April 23rd, 1874. Passed through Poly. Acad., Stockholm, 1896. Assistant Royal Swedish Telegraph Dept., 1892. Teacher at Swedish Artillery and Engineers' College, 1904, and College for Naval Officers, 1908. Head of the Telegraph Department's School, 1902. Publications: "Lärobok in Telegrafi," 1914, and "Handbok i Radiotelegrafi," Stockholm, 1908. Address: Malmskillnadsgatan 19 B, Stockholm.

Hooper, Commander Stanford C., United States Navy.—In charge of Radio material, construction, supply and development in the Bureau of Engineering attached to the U.S. Navy. B. August 16th, 1884, Colton, Cal. Educ. at San Bernardino, California. Started his career as telegraph operator in the Southern Pacific Company, afterwards transferring to the Postal Telegraph Company. Entered the Naval Academy, Annapolis, Md., September 6th, 1901. Graduated January 31st, 1905. Served as midshipman on the cruiser "Chicago," destroyer "Perry," and monitor "Wyoming," and later on various ships as ensign, 1907, lieutenant, 1910, lieutenant-commander, 1915, commander, 1918. Instructor of electrical engineering, physics, and chemistry at the U.S. Naval Academy, 1910-11. Fleet Radio Officer of the United States Atlantic Fleet, 1912-13, taking part in the capture of Vera Cruz, Mexico. Early in the war acted as observer in Europe. In charge of the Radio Division Bureau of Steam Engineering, Navy Department, 1915-17. Commanded the destroyer "Fairfax" in the Atlantic during 1917-18, then returned to take up duties in the Navy Department, 1918. Address: Navy Dept., Washington, U.S.A.

Hope-Jones, Frank, Chairman, Wireless Society of London.—B. 1867. From 1890 to 1895 associated with his elder brother, Robert Hope-Jones, in some of his earliest applications of electricity to organ-building. Has established the business of electric time service on a scientific basis. Member of the Institution of Electrical Engineers and the British Horological Institution. Author of numerous contributions to technical journals and to the Proceedings of Scientific Societies. Address: 32 and 34, Clerkenwell Road, E.C.1.

Howe, Prof. George William Osborn, D.Sc., M.I.E.E.—B. 1875, Charlton, Kent. Educ. the Roan School, Greenwich, Woolwich Polytechnic, Durham University. Nine years with Siemens Bros., at Woolwich, and Siemens and Halske, at Charlottenburg. Two years lecturer at Hull Technical School. Lecturer and later Assistant Professor of Electrical Engineering at the City and Guilds Engineering College, which forms the engineering section of the Imperial College of Science and Technology at South Kensington. D.Sc. of Durham, hon. D.Sc. of Adelaide University. Whitworth Scholar. Has read several papers on Radiotelegraphy before the Royal Society, the British Association, the Physical Society, etc. Awarded the silver medal by the Royal Society of Arts (1912) for his paper on "Some Recent Developments in Wireless Telegraphy." Fellow of the Physical Society. Member of the Radio Research Board and of the Radiotelegraphic Research Committee of the British Association. Chairman of the Wireless Section of the Institution of Electrical Engineers. Head of the Department of Electric Standards and Electric Measurements at the National Physical Laboratory, 1921. Appointed in the same year to the James Watt Chair of Electrical Engineering in the University of Glasgow. Editor *Radio Review*. Address: National Physical Laboratory, Teddington.

Hoyle, Lieut. Bertram, M.Sc. (Tech.), Assistant Lecturer, Victoria University and College of Technology, Manchester.—B. Oldham. Educ. College of Technology, Manchester (of which he is now an Associate), and at the Victoria University, Manchester. In 1907 he obtained the Certificate and Diploma in Technology and M.Sc. (Tech.) of Victoria University. Served with Messrs. Henry Simon, Ltd., Manchester, and with Messrs. S. Z. de Ferranti, Ltd., Hollinwood. Assistant Lecturer and Demonstrator in Electrical Engineering at the College of Technology, Manchester, 1911. Had charge of the design and erection of the wireless station with which the School of Technology is equipped. Enlisted early in 1915 as a motor cycle despatch rider, and served on the Western Front. In September, 1915, gazetted Lieut. R.N.V.R. Author of "Standard Tables and Equations." and a number of technical essays and monographs. Address: 18, King's Drive, Heaton Moor, near Stockport.

Isaacs, Godfrey C.—Educ. England, France, and Germany. Began life in his father's business, and a few years later was manager. Managing Director of Marconi's Wireless Telegraph Co., Ltd., and the Marconi International Marine Communication Co., Ltd., 1910. Address: Lyne Grove, Virginia Water, Surrey.

Isbell, Arthur A., General Superintendent, Pacific Division, Radio Corporation of America, San Francisco. Started in telegraph business in 1893, as a messenger for the Western Union Telegraph Company at North Adams, Mass., U.S.A. Entered service of original De Forest Wireless Telegraph Company, New York, in 1902. Later associated with Professor R. A. Fessenden for three years in numerous experiments in U.S.A. and Scotland. First merchant marine radio operator in the Pacific Ocean on steamer "President," in 1907. In 1908 built semi-high power station in Hawaiian Islands, and established first wireless communication

between the Islands and the mainland of United States. In 1910 erected first wireless station at Wellington, New Zealand. Division Superintendent, United Wireless Telegraph Company, New Orleans and San Francisco. Built Alaskan Circuit for Marconi Wireless Telegraph Company of America. 1917-1918, Expert Radio Aid, Navy Department, Washington, D.C.

Jackson, Admiral of the Fleet Sir Henry Bradwardine, G.C.B., K.C.V.O., D.Sc., LL.D., F.R.S., M.I.E.E.—B. Barnsley, January 21st, 1855. Entered Royal Navy December, 1868. Capt. 1896; Rear Admiral 1906; Controller of Navy 1905-08; Commanded 6th Cruiser Squadron 1908-10; Chief of Naval War Staff 1912-14; First Sea Lord May, 1915-December, 1916; President R.N. College, Greenwich, 1917-19. Hon. Vice-President of Inst. of Naval Architects. Vice-President of Wireless Society of London. Chairman of Radio Research Board 1920. Hon. D.Sc. Leeds and LL.D. Cantab. Whilst Commander of H.M.S. "Edinburgh," in 1893, conceived the idea of using Hertzian Waves for Naval signalling purposes, especially in connection with torpedo boat work, experimented intermittently in this direction by exciting a circuit which included a filings coherer tapped by the hammer of a high-resistance trembling bell. Continued to take much interest in the development of W/T, and assisted in its organisation in the Navy. Address: 37, Catherine Street, London, S.W.1.

Janet, Paul, Membre de l'Institut. Professor of Physics, University of Paris, Director of the Central Laboratory and of the High School of Electricity.—B. January 10th, 1863, in Paris. Studied at the Lycée Louis-le-Grand and the High School. Member of the French Society of Physics, the International Society of Electricians, and the Society of Civil Engineers of France. Professor of Physics at the University of Grenoble, 1886-94. Author of several important works. First to make a successful experiment in electric resonance by means of high-frequency currents, 1892; this is the phenomenon used to-day in wavemeters.

Jenner, Axel.—B. 1885. Student 1904. Assistant at the Swedish Telegraph Service 1905. Passed the course for superintendents of the wireless stations 1916. Since 1916 superintendent of the wireless station at Boden, Sweden. Address: Boden, Sweden.

Jotikasatira Hang, Chief of the Wireless Department of the Naval General Staff, Siam.—B. at Bangkok, September 27th, 1876. Educ. at Bangkok and at Penang. In 1890 he was sent to Europe to be educated as an engineer. He studied seven years at Erfurt, and entered the Technische Hochschule at Hanover in 1897. On passing the final examination of that school in 1902, he returned to Siam and joined the Siamese Navy as an Engineer-Lieutenant. 1907-12, an instructor in the Naval Cadet School. Awarded the title of Luang Nava Vichitr, 1911. Joined the Naval General Staff as the Chief of the Wireless Department, 1912. Promoted Commander 1918. Awarded the title of Phra Vidyu Düralikhit 1920. Address: Bangkok.

Kadōka, Hayao.—B. Tokyo, March, 1883. Graduated from the Tokyo Imperial University, July, 1906. Studied at the Earthquake Investigation Committee in the Dept. of Education, November, 1908. Lecturer at the Science College of the Tokyo Imperial University, March, 1909. Served in the Army, for researches on radiotelegraphy. Proceeded to Europe and America for inspection of the war-time condition of radiotelegraphy, 1917-1918. Since 1911 designed several radio stations. Address: 114, Sanya Yoyogi, Tokyo.

Kajima, Akira.—B. Tokyo, 1883. Graduated from the Greek Catholic Mission School, Tokyo, 1904, and became publisher of a religious magazine. Interpreter at the French Embassy from 1905 to 1906. Received a medal in recognition of distinguished services. Joined the editorial staff of the *Chuo Shimbun* in 1906, and that of the *Kokumin Shimbun* in 1908. Established the Japanese Wireless Press Agency in 1911 and the Nippon Radio Apparatus Manufacturing Company, 1915, which was converted to the Nippon Radio Telegraphy and Telephony Co., Ltd., 1920, and became the Managing Director the same year. Retired 1921. Started a monthly magazine named *Musen no Nippon* or Wireless Press in 1918. Private residence: 16, Kobinata-Daimachi 1 chome, Koishikawa, Tokyo.

Kennedy, Sir A. B. W., F.R.S.—B. London, March 17th, 1847. He has had great mechanical engineering experience. Some time President of the Institution of Civil Engineers, and the Institution of Mechanical Engineers. Professor of Engineering at University College, London, 1874-89, and founded there the first "Engineering Laboratory." Designed electric lighting and power stations for many companies and corporations, and has also been engaged in railway and constructive work. Knighted 1905 for his services to the Admiralty. Member of the Technical Committee appointed by the Postmaster-General to consider the Imperial Wireless Scheme. Civilian Member of the Ordnance Committee. During the War was Member of the Munitions Inventions Panel, and Vice-chairman of the Anti-Aircraft Equipment Committee (Ministry of Munitions). Consulting Electrical Engineer to the L.N.W.R., L.S.W.R., and the London County Council. Chairman of the Electn. of Railways Advisory Committee (Ministry of Transport). Address: A7, The Albany, Piccadilly.

Kennelly, A. E.—B. Colaba, Bombay, December 17th, 1861. Educ. in England, Scotland, Belgium, France and Italy. Past-President of the American Institute of Electrical Engineers, Past-President of the American Association of Illuminating Engineers; President, in 1916, of the Institute of Radio Engineers; Vice-President of the International Electrical Congresses, Paris and Turin; General Secretary of the Congress at St. Louis, Mo., U.S.A. Left school in 1875 to become a telegraph operator in the Eastern Telegraph Company. Chief Electrician on Cable Ship, 1881; Senior Electrician ship staff, E.T.C., 1886. Principal electrical assistant to Thomas A. Edison, in the laboratories at Orange, N.J., 1886-92. Consulting Engineer in Philadelphia. In partnership with E. J. Houston, of the Thomson-Houston Company, 1893-1900. Engineer-in-Chief when the cables were laid from Vera Cruz to Campeche, 1902. Professor of Electrical Engineering at Harvard University and also at Massachusetts Institute of Technology, since 1914. Corresponding Fellow of the British Association for the Advancement of Science; Honorary Member of the Institution of Electrical Engineers of London, and has twice received one of its premiums for papers. Director of Research Division of the Electrical Engineering Department, Massachusetts Institute of Technology, and Fellow of the American Academy of Arts and Sciences. He has written twenty-three books as author or collaborator, one of which is

considered a standard elementary exposition of wireless telegraphy, and is author of more than 120 scientific papers. Honorary degrees include the S.D. of University of Pittsburg and A.M. degree of Harvard University. Some time Chairman and Secretary of Standards Committee, American Institute of Electrical Engineers, President and Secretary of the American Committee of the International Electro-Technical Commission. On duty as exchange Professor in French Universities, 1921-22. Member National Ac. Sciences. A delegate to the Inter-allied Radiotechnical Committee in Paris, 1921. Has specialised in alternating currents. Address: c/o Morgan-Harjes & Co., 14, Place Vendôme, Paris, 1e.

Kilt, A. A.—B. London, 1881. Educ. City of London School and Finsbury Technical College. Joined Marconi Company, 1902. Acted as erecting engineer supervising the installation of many of the earlier ship stations, including those on board the first vessels of the White Star fleet to be equipped. In charge of the installation of the Post Office Wireless Stations at Lochboisdale, Tobermory and Bolt Head. Appointed Chief of the Estimating Department of Marconi's Wireless Telegraph Company, 1911.

Kimura, Shunkichi, Ph.D.—B. 1866. Graduated Scientific College of the Tokyo Imperial University, in the department of Physics, 1888. Lecturer of the First High School in Tokyo. Studied Mathematical Physics in Harvard and Yale Universities 1893-95. Received the degree of Ph.D. (Yale), 1895. Member of Sigma Xi Society. Visited Holland, Co-founder with Dr. Molenbroek, assisted by Professor Tait, of Edinburgh, and Dr. Joly, of Dublin, of the Association for Promoting the Study of Quarternions and Allied Subjects. Returned to Japan. Professor of the Second High School in Sendai. Transferred to the Imperial Japanese Navy, 1901, to investigate wireless telegraphy for naval use. Invested with Order of Rising Sun (5th Class), 1903. Invested with Order of Rising Sun (3rd Class) with annuity, 1906. Fellow of the Royal Society of Arts, 1906. Japanese delegate to the International Wireless Telegraph Conference, Berlin, 1906. Retired from the Navy, 1912. Patent Attorney, with office at the Mitsui Building, Honkawayacho, Nihonbashi, Tokyo. Director of various companies, including the Nippon Radio Telegraph and Telephone Company. Engaged in the successful litigation of the General Electric Company against some Japanese firms for infringement of the patents with respect to ductile tungsten. Author of several papers on wireless telegraphy. Address: Momosono, Nakano, Tokyo.

Kojima, Kiyoshi.—B. Tokyo, January, 1889. Graduated from the Science College of the Kyushu Imperial University, July, 1915. Entered the service of the Department of Communications and engaged in scientific researches at the Electrical Laboratory under Dr. Wichi Torikata. Joined Nippon Radio Apparatus Manufacturing Company as chief of Engineering Department, April, 1916, and became a director when the above company was changed to the Nippon Radiotelegraphy and Telephony Co., Ltd., 1920. Address: 1280 Shimo-Shibuya, suburb of Tokyo.

Kolster, Frederick A.—B. Geneva, Switzerland, January 13th, 1883. Educ. Public Schools of Cambridge, Mass., and at Harvard University. Assistant to John Stone Stone 1902-08. Took an active part in wireless engineering up to 1912. Joined the scientific staff of the U.S. Bureau of Standards, 1912, and has been closely associated with the radio work of the U.S. Government. Research Engineer, Federal Telegraph Co. Inventor of a direct reading decremeter, directional radio systems, and other devices. Fellow of the Institute of Radio Engineers. Attaché to American delegation representing the U.S. at London International Radio Convention in 1912. Member American Institute of Electrical Engineers. Member Cosmos Club, Washington, D.C.; Engineers Club, San Francisco, Cal. Address: c/o Federal Telegraph Co., Palo Alto, California, U.S.A.

Koomans, Nicolaas.—B. December 18th, 1879, at Delft. Studied at Delft for mechanical and electro-technical engineer, obtaining his certificate, 1901. For one year assistant in applied geometry, and for one and a half years in physics and electrical engineering at the Technical High School at Delft. Entered the Government Telegraph Service. Grad. 1908 at Technical High School at Delft as Doctor in Technical Sciences on the strength of a dissertation "Regarding the Influence of Self-Induction in Telephone Conducting Wires," containing theses in which are laid down the results of, and the conclusions from, experiments and measurements on Pupin cables of the Dutch telegraph administration. Joint-founder and editor of the Monthly Review of Telephony and Telegraphy. Joint-founder and member of the managing board of the Dutch Society for Radiotelegraphy (Nederlandsche Vereeniging voor Radiotelegrafie). Member of the International Electro-technical Commission. Professor in Physics and Theoretical Electrical Engineering at the school of the Dutch Post and Telegraph Administration. Supervises the instruction of all the higher officials. Address: Antonie Duyckstraat 24, The Hague, Holland.

Korn, Professor Arthur.—Professor at Polytechnical High School, Charlottenburg, Berlin. B. Breslau, Germany, May 20th, 1870. Studied at Leipsic and Paris in Mathematics and Physics. Professor of Physics, University of Munich, 1903-08. Best known as the inventor of a system of telegraphic transmission of photographs, an in 1907 the first photograph was transmitted under his system from Munich to Berlin, a distance of 600 kilometres. Inventor of a system of telautography and wireless phototelegraphy. Author of "Elektrische Fernphotographie und Aehnliches," Leipsic, 1904, and "Handbuch der Phototelegraphie und Telautographie," published in 1911 in collaboration with Dr. Glatzel. Address: Charlottenburg, Berlin Schluterstrasse 25.

Koto, Major-General, Teizo, Military Engineer.—B. Yamaguchi prefecture, May, 1873. Entered the military service as cadet in the 6th Engineering Battalion, 1892, and promoted to 1st Lieutenant, May, 1898. Entered the Science College of the Tokyo Imperial University as a special student of the School of Artillery and Engineering, 1900, and graduated therefrom 1903. Served in the Russo-Japanese War as the chief of the Field Telegraphy Corps, 1904. Promoted Major and appointed an inspector of the Military Technical Dept., 1905. Promoted Lieut.-Major and appointed Member of the Military Wireless Investigation Committee, 1910. Proceeded to China for the erection of a radio station on Chinwangtao Island, 1912. Promoted Colonel and Chief of the Communications Dept. of the Tsingtau Garrison, 1915. Engaged in the erection of radio stations at Hankow and Tsinan. Promoted Major-General and Military Engineer, 1919. Address: 68, Tani-Machi, Ichigaya, Ushigome, Tokyo.

Krarup, T. F., Knight of Dannebrog.—B. Copenhagen, August 16th, 1868. Student 1885. Young lawyer 1891. Head clerk to Criminal Judge at Frederiksberg, 1891. Assistant in the Ministry of Home Affairs, 1894. Assistant to Copenhagen Harbour Administration, 1896-1907. Head clerk to Ministry of Public Works 1904; Chief from 1912. Vice-President of the Electricity Commission, 1907; Chairman from 1916. Chairman of the Cement Commission, 1917. Member and Secretary of the Telephone Commission of 1917, from 1917; Chairman from 1920. Chairman of the "Gudenaa" Commission and the other Commissions concerning water power plants 1918, and of the Commission regarding Long Distance Radio Telegraph Stations. Address: Frederiksberg Allé 55, Copenhagen V, Denmark.

Kroger, F. H.—Educ. University of Colorado. Graduated M.S. 1905. Apprenticed to the Westinghouse Electric and Manufacturing Co., East Pittsburg, 1905. Engineer at Brant Rock Transatlantic station of the National Electric Signalling Co., 1906. Radiotelegraph Adviser to the States Signal Corps (1907), which installed the Inland Radio Station in Alaska. Organised educational courses in electrical engineering and in radiotelegraphy at Cornell University, 1908-11. Joined the International Radiotelegraph Company, New York, 1911. Joined the Marconi Wireless Telegraph Company of America (1919) as division engineer at their factory. Joined staff Radio Corporation of America, 1920. Address: 54, Martense Street, Brooklyn, New York.

Kujirai, Tsunetaro, Professor of the Tokyo Imperial University.—B. 1882. Graduated Electrical College of Tokyo Imperial University, 1907. Some time Wireless Engineer in the Department of Communications, and Assistant Professor of the Tokyo Imperial University. Awarded the Academy prize and medal of the Japanese Imperial Academy. Member of the Institute of Physical and Chemical Research. Address: Tokyo Imperial University, Hongo, Tokyo, Japan.

Langmuir, Dr. Irving, M.A., Ph.D. of University of Gottingen (1906).—B. Brooklyn, New York, January 31st, 1881. Educ. School of Mines, Colombia University; Graduated 1903 as metallurgical engineer. Undertook post graduate work at University of Gottingen under Professor Nernst. Returned to America and became Instructor in Chemistry at the Stevens Institute of Technology, 1906-09. Entered Research Laboratory of G.E.C. at Schenectady, 1909, where his investigations have included Radio Telephone and Telegraphic Apparatus, Tungsten Lamps, Electric Heating Devices, Pure Electron Discharge Apparatus, Atomic and Molecular Structure, etc. During the war engaged on submarine problem and developed several successful detecting devices used by the United States Navy. Has been a frequent contributor to various scientific journals and published many scientific works. Addresses: G.E C. Research Laboratory, Schenectady, New York. 6, Stratford Road, Schenectady, New York.

Latour, Marius.—B. October, 1875, in South-western District of France. Educ. University of Paris and Ecole Supérieure d'Electricité, Paris. For many years consulting Engineer to the General Electric Company of America. Has identified his name with numerous inventions in various domains of science, including improvements to the helicopter, submarine signalling, and notably in dynamo-electrical machinery. Paid special attention to the construction of high-frequency machines, which he originally attempted to design in the shape of monophase or polyphase machines grouped in cascade. Analysed the essential features of machines based on this principle, and showed their analogy and close relationship to those of Professor Goldschmidt. Designed the H.F. alternator with reduced number of stator slots known as the S.F.R. alternator installed at numerous stations, including Lyons and Coltano. Presented an original paper to the Technical Manager of the General Electric Company at Schenectady in 1904, setting forth the principle of the reception of continuous waves by beats, and this method of C.W. reception is to-day in general use. Systematically studied the triode valve and originally propounded the four determining derivatives thereof. During the war engaged in research work at the laboratories of the Etablissement Central de la Télégraphie Militaire under General Ferrié. His system of elimination of the interference produced in telephone lines by neighbouring H.T. power lines has been installed throughout the whole of Northern France. Originally suggested and patented the system, now widely used, of H.F. multiplex telegraphy and telephony using triode valves for generation and reception. Has specialised in the development of high and low-frequency valve amplifiers for the Société Française Radio-Electrique, of which he is Consulting Engineer. Chevalier de la Légion d'Honneur. Vice-President of the Société Française des Electriciens. Member of the American Institute of Electrical Engineers. Member of the Institute of Radio Engineers. Head Lecturer at the Ecole Supérieure d'Electricité. Address: 8, Square Desaix, Paris, XVe. Telephone: Saxe 85-88.

Lippmann, Gabriel.—Of the Académie des Sciences at the Bureau des Longitudes. Commander of the Legion of Honour. Director of Laboratory of the Ecole des Hautes-Etudes. Professor at the Sorbonne. President of the Interministerial Commission on Wireless Telegraphy. Occupied primarily with electrical matters. Inventor of an apparatus employed in Military Wireless Telegraphy for receiving Wireless Time Signals. Foreign Member of the Royal Society of London. Address: Sous-Secrétariat d'Etat des Postes et Telegraphes, Paris.

Litström, Axle Sigurd.—B. Falun, Dalecarlia, September 3rd, 1881. Passed Mautority Examination 1900. Examination of Electro-Technical Branch, Technical University, Stockholm, 1905. Entered the Telegraph Service, 1900. Inspector of wireless installations, 1913. Chief Engineer at the Radio Division of the Royal Telegraph Administration, Stockholm, 1920.

Ljungqvist, Seth.—B. Falun, Dalecarlia, Sweden, May 5th, 1880. Passed Mautority Examination, 1899, and Examination of Electro-Technical Branch, Technical University, Stockholm, 1904. Entered the Telegraph Service, 1899. Chief of the Radio Division in the Royal Swedish Telegraph Department, Stockholm, 1916. Address: Vanadisvagen 23, Stockholm.

Lodge, Sir Oliver, D.Sc., F.R.S.—B. Penkhall, Staffs, June 12th, 1851. Educ. at Newport (Salop) Grammar School; studied privately for several years. Entered University College, London, 1873. Graduated D.Sc. 1878. Reader in natural philosophy at Bedford College for Women, and Assistant Professor of Physics in University College, London, for several years, and Professor of Physics at University College,

Liverpool, 1881-1900. The First Principal of Birmingham University, 1900. Knighted, 1902. Original investigations on lightning, the seat of the electromotive force in the voltaic cell, the phenomena of electrolysis and the speed of the ion, the motion of the ether near the earth, and electromagnetic waves and wireless telegraphy. His patent (1897) for syntonic wireless telegraphy was extended for seven years by Lord Parker, and was acquired by the Marconi Co. in 1911. Has held the position of President of the British Association, President of the Physical Society, and of the Society for Psychical Research. Has made many important contributions to the literature of science. Address: Normanton, Lake, Salisbury.

Loring, Commander F. G., R.N., M.I.E.E.—Inspector of Wireless Telegraphy, General Post Office. Entered the Navy in 1882 (retired 1910). Lieutenant on H.M.S. "Victoria" when that vessel was rammed and sunk by H.M.S. "Camperdown" off Tripoli (1893). Received Bronze Medal of Royal Humane Society for saving two lives. In charge of Admiralty shore wireless stations 1902-08. Admiralty delegate at Berlin International Conference on Wireless Telegraphy, 1906. Appointed Inspector of Wireless Telegraphy, 1908. Post Office delegate at International Conference on Wireless Telegraphy, London, 1912. Technical Adviser to the Board of Trade on Wireless matters at International Conference on Safety of Life at Sea, London, 1914. Address: The Old House, Foot's Cray, Kent.

Lyons, Colonel Henry George, D.Sc., F.R.S.—B. October 11th, 1864. Educ. Wellington College, Director-General of the Survey Department in Egypt, 1898-1909, gaining Victoria Research Medal, R. Geog. Soc., 1911. Member of the Meteorological Committee, 1913. Commandant Army Meteorological Services, during the War; Acting Director Meteorological Office, 1918-19. Chairman of Sub-Committee "B" on Atmospherics of Radio Research Board of the Department of Scientific and Industrial Research. Keeper, Science Museum, 3, Cambridge Square, W.2.

Machado, Alvaro de Melo, Commander in Portuguese Navy, and Torpedo Operating Officer of the Naval College of Val de Zebro.—B. February 22nd, 1883. Entered Portuguese Naval Service, 1904, and elected Member of the Portuguese Academy of Science for his original design of wireless-controlled torpedo in 1907. In 1915, whilst only Second Lieutenant, became Manager of the Electrical Services of the Marine Arsenal, and was responsible for the direction of the installations made in the National Naval Units and Land Stations of the Navy. Reorganised the dismantled wireless on German vessels confiscated during the war. Received Portuguese Distinguished Service Medal, and made Member of the "Académie Française" in 1917, in acknowledgment of his wireless work. Address: Ministry of Commerce, Lisbon.

Makower, A. J., M.I.E.E.—B. May 9th, 1876. Educ. University College School, Gower Street, and at the College itself, between 1884 and 1895. Studied mathematics at Trinity College, Cambridge, taking his degree, 1898. Proceeded to Technical School, Charlottenburg, Germany, and obtained valuable insight into German methods. Joined the British Thomson-Houston Company, Rugby. Received an appointment at the South-Western Polytechnic, Chelsea, 1904. As head of the Electrical Engineering Department at the Polytechnic, was closely connected with the University of London, of which he was a teacher. At one time Secretary of the Board of Studies in Electrical Engineering, and Chairman of the Board of Examiners in Electrical Engineering. Author of many valuable papers on wireless subjects. Resigned his teaching post and became managing director of Mossay & Co., Ltd., designers and selling agents for commercial electric vehicles, 1918. A member of the Electric Vehicle Committee of Great Britain. Address: 12, Greencroft Gardens, N.W.6.

Makower, Capt. W., M.A., D.Sc.—B. December 6th, 1879. Educ. University College School and University College, London. Took honours degree in Chemistry at the University of London, 1900. His early research work relates to investigations in heat, but on proceeding to Trinity College, Cambridge, 1902, commenced investigations at the Cavendish Laboratory on radio-activity. Elected to a Research Fellowship in the University of Manchester. Subsequently Assistant Director of the Physical Laboratories. Continued these researches until 1917. Joined the R.N.V.R. as a lieutenant, 1917, and subsequently became captain in the R.A.F. During the war, at the Air Ministry Laboratory in the Imperial College of Science and Technology, working on thermionic valves and other matters connected with wireless telegraphy. Since the Armistice has been engaged on various problems connected with wireless telegraphy and navigation being investigated at the Air Ministry Laboratory. Most of his scientific publications have been in connection with radio-activity, of which, perhaps, the most important are on the subject of radio-active recoil, which he discovered with Dr. S. Russ in 1909, and he was awarded the degree of D.Sc. at London as a result of his early investigations in this subject. Of his other contributions to Science are his work on the Electric State of the Upper Atmosphere and his books on *Radio-Active Substances* and *Practical Measurements in Radio-activity.* Elected a fellow of University College, London, 1912, and for some years past has acted as Recorder of Section "A" of the British Association.

Marchant, Edgar Walford, D.Sc., M.I.E.E.—David Jardine Professor of Electrical Engineering in the University of Liverpool. B. Kent, 1876. Educ. University School, Hastings, and Central Technical College. Graduated B.Sc. at London University with honours in physics and mathematics, and subsequently took the degree of D.Sc. After serving an apprenticeship appointed Superintendent of Lord Blythswood's Laboratory and Workshops at Renfrew, N.B., 1897, where he carried out many experiments in wireless telegraphy. Leaving Renfrew in 1900, served as chief assistant for one year at the Finsbury Technical College under the late Professor Silvanus P. Thompson. Lecturer in electro-technics at University College, Liverpool, 1901, and on the establishment of a Chair of Electrical Engineering in 1903 was elected the first professor. Closely associated with the late Mr. Duddell in the development of the oscillograph and joint author of a paper read before the Institution of Electrical Engineers on the study of the electric arc by the aid of oscillographs. Author of a number of articles on wireless and cognate subjects, and was one of the British delegates to the Scientific Commission on Wireless Telegraphy, held in Brussels, April, 1914. Vice-President of the Wireless Society of London, Past President of the Liverpool Engineering Society, Past Chairman of the Manchester Section of the Institution of Electrical Engineers. Address: 2, Ivanhoe Road, Sefton Road, Liverpool.

Marchant, W. H.—B. London, March 22nd, 1881. Commenced experimental work in connection with W/T (1904). From 1906-11 he served with De Forest Syndicate, Poulsen Company, and Lepel and Anglo-German W/T Companies, being chiefly engaged in experimental work. Since 1911 he has devoted himself mainly to literary work and to teaching. At present in the service of the Eastern Telegraph Co., at their London training centre. Address: 4, Branch Hill Side, Hampstead, N.W.

Marconi, Alfonso.—B. Bologna, 1865. Educ. Bedford Grammar School, England, and Technical Colleges in Florence and Leghorn. Assisted his brother in carrying out his first experiments in Wireless Telegraphy on one of his father's estates near Bologna. Joined the board of Marconi's Wireless Telegraph Company and the Marconi International Marine Communication Co., Ltd., July, 1909. Address: 75, Harley House, Regent's Park, London, N.W.1.

Marconi, Senatore Guglielmo, G.C.V.O., LL.D., D.Sc., M.I.E.E.—B. Bologna, Italy, April 25th, 1874. Irish on his mother's side. Educ. Leghorn and Bologna. First interested himself in the problem of wireless telegraphy, 1895. Visited England, 1896, and took out the first patent ever granted for a practical system of wireless telegraphy by the use of electric waves. Earliest experiments in England made at Westbourne Park. Shortly afterwards Senatore Marconi made some experiments for the Post Office officials. The Italian Government conferred upon Mr. Marconi the honour of knighthood. Senatore Marconi has been decorated by the King of Italy and the late ex-Czar of Russia, is an honorary doctor of many universities, including Oxford, Glasgow, Aberdeen, Liverpool, and Pennsylvania, besides having received the freedom of the principal Italian cities. In 1909 (in conjunction with Professor Braun) he was awarded the Nobel Prize for Physics. In 1912 he was decorated with the Grand Cross of Alfonso XII and made Grand Officer of the Order of St. Maurice and Lazarus. Elected a senator in the Italian Parliament (1914), being formally introduced to the Assembly on March 27th, 1915. On July 24th, 1914, the King bestowed upon him the Honorary Knighthood of the Grand Cross of the Victorian Order. He also holds many scientific awards granted by various societies and institutions, of which we may quote as a comparatively recent instance his presentation by the Royal Society of Arts, on April 12th, 1915, of their Albert Medal. Immediately on the declaration of war by Italy, Senatore Marconi was given the rank of Lieutenant in the Italian Army. He has been employed on important military missions to England by the Italian Government, and on July 29th, 1916, was promoted Captain "for exceptional services." At the beginning of September, 1916, he was transferred from the Italian Engineer Service to be temporary Commander in the Navy. Senatore Marconi visited the United States, 1917, as Member of the Official Mission sent by Italy to the U.S.A. Government. The University of Columbia invested him with the honorary degree of Doctor of Science on June 6th, 1917. The Franklin Institute of Philadelphia conferred their Franklin* Gold Medal upon Senatore Marconi on May 15th, 1918. On June 26th, 1919, Senatore Marconi was appointed by H.M. the King of Italy Plenipotentiary Delegate to the Peace Conference at Paris, and in this capacity he signed the Peace Treaties with Austria and Bulgaria. At the end of 1919, Senatore Marconi was awarded the Italian Military Cross. Senatore Marconi, who is decorated with the Italian "Ordine Civile" of Savoy, has been nominated by the King of Italy to be a member of the Supreme Council of the same Order on the proposal of Signor Giolitti. In addition to being Chairman of the Board of Directors of the Marconi Company, Senatore Marconi is Chairman of the Banca Italiana Disconto and of the Lloyd Sabaudo Steamship Company.

Marriott, Robert Henry, Expert in Radiotelegraphy, U.S. Navy.—B. 1879. First experimented with wireless telegraphy in 1899, while student at the Ohio State University, U.S.A. Employed by the American Wireless Telephone and Telegraph Company, Philadelphia, 1901, for which company he erected stations at Breille, Galilee and Barnegat, N.J. Chief Engineer of the Pacific and Continental Wireless Telephone and Telegraph Company. Installed three stations in California, at Avalon, Santa Catalina Island, and San Pedro, 1902. Employed with the Carstarphen Electric Company at Denver, Colorado, 1903. Constructed stations for the American De Forest Wireless Telegraph Company, and its successor, the United Wireless Telegraph Company, in Colorado, Wyoming, and Texas, 1905. In charge of this Company's construction and maintenance, 1910. Entered Marconi Wireless Telegraph Company of America, 1911. Entered the U.S. Government service as Radio Inspector, 1912. Chairman, 1916, Seattle Section Institute of Radio Engineers. Member of the Committee on Standardisation. Fellow and Past-President The Wireless Institute, 1909-12.

Marvá, General J.—B. 1846. Practically the pioneer of Wireless Telegraphy in the Spanish Army. Founder of first Spanish Aerodrome at Cuatro Vientos. Author of many scientific works (*Mecánica aplicada a las construcciones*, *Tración en Vias ferreas*, etc.), Member, Royal Academy of Sciences, and International Association for experiments of materials.

McLachlan, Norman W., D.Sc. (Eng.), M.I.E.E.—Associate of the Heriot-Watt College and a D.Sc. (Engineering) of the University of London. Author of many papers on various subjects in the *Journal of the Institution of Electrical Engineers* and other scientific journals. Research Engineer in service of Marconi Company. B. Longtown, Cumberland, 1888. Educ. Carlisle Grammar School and the George Watson and the Heriot-Watt Colleges, Edinburgh. Served apprenticeship with Messrs. Bruce, Peebles and Co. In 1909 was appointed Lecturer in Engineering and Mathematics at Newcastle-on-Tyne. In 1913, Superintendent of a Technical Institute, and Supervisor of Classes in Engineering Subjects in the Liverpool Technical Institutes. During the war carried out much research work for Government in aeronautics and anti-submarine devices, organising a laboratory at Air Ministry for research on liquid and gaseous oxygen apparatus for aircraft use. After the Armistice engaged in magneto research at the National Physical Laboratory, Teddington. Address: Marconi Works, Chelmsford.

McMichael, H. Leslie, Honorary Secretary, Wireless Society of London.—B. Birkenhead, 1884. Educ. Ackworth and Technical College, Birmingham. Apprenticed to Messrs. Duckett and Brown, Electrical Engineers, Birmingham, afterwards taking control of one branch of the business. Among the first to hold a receiving and transmitting license in London, and had a highly efficient station in London prior to 1914. His work lay chiefly in the direction of sensitive

synthetic crystals, and with Mr. R. H. Klein he was responsible for the synthetic crystal "Radiocite." One of the moving spirits in the foundation of the Wireless Society of London, and has taken an important part in its management since its origin; first in the office of Vice-Chairman, and since 1919 as Honorary Secretary of the Society. During the war served in the Wireless Instructional Section of the R.A.F. Member of the Institute of Radio Engineers and a Director of some commercial concern. Address: 32, Quex Road, West Hampstead, N.W.6.

McPherson, Andrew, A.M.I.E.E., A.M.I.Mech E., M.I.Radio E. Head of the Wireless Shore Station Division of H.M. Signal School, Portsmouth.—B. 1880. Educ. at Allen Glen's School and the Royal Technical College, Glasgow. Engineering training with the Electric Construction Co., Ltd., of Wolverhampton. Was appointed Assistant Engineer to the Public Works Department of the Nigerian Government, Chief Engineer of the Nova Empreza Luz Electrica, Maceio, Brazil, and later Engineer and Manager of the Madiera Electric Lighting and Power (1909) Co., Ltd., Funchal, Maderia. Was for some time acting as special Brazilian correspondent to the "Electrical Review." Joined the G.P.O. in connection with the original scheme for the Imperial Wireless Chain, and in 1915 was transferred to the Admiralty in connection with Wireless Telegraphy Engineering. From 1915 to 1917 was engaged in inspecting and reporting on Wireless Telegraphy Stations abroad, visiting practically all Naval Overseas Wireless Telegraph Stations in every part of the world. Address: 22, Cousin's Grove, Southsea, Hants.

Meissner, Alexander.—B. Vienna (Austria) Studied at Technical High School and University, Vienna. Joined the Laboratory of the Telefunken Company, Berlin, 1907, and since that time has taken a very prominent part there in the development of the technique of wireless in Germany, having been responsible for the introduction of the Flat-coil, the most favourable diameter for high-frequency coils, musical quenched sparks, timed sparks, high-frequency machine, Telefunken compass, interference-reception with the detector, direct current cathode valve relay for Morse reception, etc. Invented the generation of oscillations with three electrode valves, 1913, as well as the triode, with back coupling for reception by beats. Has published a series of articles on his work in different periodicals.

Minohara, Dr. Eng., Lieut.-Com. (of Ordnance), Tsutomu.—Graduated from the Tokyo Imperial University, 1907. Entered Naval Arsenals of Maizuru and Kure and engaged in the manufacture of electrical equipment for radiotelegraphy. Member of the Wireless Research Laboratory in the Electrical Department of the Arsenal, 1912 Proceeded to France and Germany to study, 1914. Ordered home in consequence of the outbreak of the Great War, and resumed service at the wireless laboratory. Inspector of *post-bellum* condition of radiotelegraphy amongst the Allied Powers. Returned to Japan, 1918, and assumed service at the wireless laboratory again. Now engaged in the equipment of radiotelegraphy aboard war vessels and construction of high-power land stations at the electro-technical section in the Naval department; also employed in the improvement of continuous wave radio apparatus at the laboratory Appointed to serve in the Department of Communications, 1919, and juror of Patent Office, 1920.

Monckton, C. C. F.—B. Great Malvern, May 8th, 1867. Educ. at Uppingham and Malvern Colleges, and at the Central Technical College of the City Guilds. Employed by the Brush Electrical Engineering Company, from whom he passed to Messrs. Boustead Brothers, of Ceylon. Filled Government appointments in Jamaica and Trinidad. Superintendent of Telegraphs and Telephones to the Government of Fiji, 1911. Censor of telegrams during the war. Superintended the erection of the first Colonial Wireless Stations in the West Indies, 1904. Author "Radiotelegraphy" (1907). Acts in an advisory capacity to the High Commissioner for the Western Pacific with regard to all matters relating to wireless in the territories under that official's jurisdiction. Address: Suva, Fiji Islands.

Montefinale, Commander G. B., Italian Navy. —B. 1881. Educ. at Technical Colleges in Italy. Entered Naval Academy, Leghorn, 1899. Officer of the R.N., 1903. First appointment on H.I.M.S. "Andrea Doria," one of the first warships fitted with W/T. Assisted on board this vessel at important experiments in Adriatic and Ionian seas while Mr. Marconi and Marquis Solari experimented with new receiving devices at Ancona. W/T teacher at the R.N. Telegraphist School, 1908-10. Landed on Benadir coast, 1911, where he took part in erection of high-power Marconi station at Mogadiscio. During the Turkish-Italian war served in the Red Sea flotilla blockading Arabian coasts as W/T officer. Director of Radiotelegraphic service in the Italian Somaliland, 1912-14, visiting the whole region, taking part in all the most important occupations and establishing new wireless links in the boundary zone (Mahaddei-Uen, Iscia Baidoa, etc.). After a period of studies at Leghorn served in the Dreadnought squadron for a long period of the war. In December, 1916, while attached to the Inter-allied staff of Brindisi, sent to Red Sea as Director of Erytrea W/T service. Remained in the Marconi H.P. station of Massawa till the Armistice, co-operating with British authorities in Aden and Egypt to establish new links. Constructed a duplex station at Asmara for metropolitan W/T service. During the summer, 1918, gave a brilliant demonstration of long distance reception in Abyssinia. Chief of W/T Laboratory and Department of Spezia, June, 1919. Author of several papers on wireless telegraphy. Active correspondent of various periodicals and reviews. Member of the specialist body of the Italian Navy.

Moreno Quesada, D. Manuel, Lieut.-Com., Spanish Rayal Navy.—Sub-Director of the Compañia Nacional de Telegrafia sin Hilos, Madrid, where he carried out duties as Chief Engineer until 1st June of last year. Engaged in wireless work since the beginning of the application of this science in Spain. Besides the studies relating to his career at the Spanish Naval School, he has passed the courses of Electrical Engineering at the London Central Technical College. One of the most notable officers of the Spanish Navy, having distinguished himself in the North African campaign. Granted Cross of Maria Cristina. Representative of the Spanish Foreign Ministry in International Radiotelegraph Conference.

Moriceau, Gaston, Capitaine (of Colonial Artillery). Technical Adviser in Wireless Telegraphy (since February, 1921), French Colonial Office.—B. Doue-la-Fontaine (France), 15th September, 1879. Studied (1900-1902), Ecole Polytechnique of Paris. Sub-Lieutenant Colonial Artillery, 1902. Before the war served at

the Central Radiotelegraphic Military Establishment. During the war Chief of the Radio-telegraphic Service of French Indo-China (except from May, 1915 to May, 1916, when he served in Society Islands).

Mullard, S. R., M.B.E., A.M.I.E.E.—B. 1883. 1908, Assistant Works Manager to Société Anonyme des Usines Pintsch. 1910-15, Head of Research Laboratory Edison & Swan Electric Co., Ltd., during which period invented and developed Pointolite Tungsten Arc Lamp. 1916-18. Lieut. R.N.V.R. attd. R.N.A.S. 1918-19, Capt. R.A.F.; Head of Wireless Telegraphy Section at Air Ministry Laboratory, Imperial College of Science, S.W.7. 1919-20, Research in wireless valve development and construction; Contractor to Admiralty, War Office, Royal Air Force and Post Office, September, 1920. Managing Director, The Mullard Radio Valve Co. Club: R.A.F. Club. Address: Orient House, New Broad Street, E.C.2.

Nally, Edward Julian, President and Director Radio Corporation of America. Born in Philadelphia, April 11th, 1859, and educated in the Public Schools. Mr. Nally is a pioneer in different modes of communication in America, having had charge of the first Edison telephone in St. Louis, Missouri, before he had obtained his majority. He started his business career as a messenger boy for the Western Union Telegraph Company, in St. Louis, and worked his way up through various steps to the position of Vice-President and General Manager of the Postal Telegraph-Cable Company, which he resigned in 1913 to accept the office of Vice-President and General Manager of the Marconi Wireless Telegraph Company of America. Under his management the first commercial wireless circuit was opened to the public between the United States and Japan, in 1914. During the period of the war commercial wireless service by private companies was interrupted, but immediately upon the return of the stations by the United States Government on March 1st, 1920, Mr. Nally established the first direct commercial wireless circuit between the United States and Great Britain, which was soon followed by similar services to Norway, Germany, and France. Upon the formation of the Radio Corporation of America, in 1919, he was elected President and Director. He is also President and Director of the Pan-American Wireless Telegraph and Telephone Company and the Wireless Press, Inc. Married Lee Warren Redd, of Lexington, Kentucky, June 10th, 1897. Children, Marylee Nally Hahn and Edward Julian Nally, Jr. Clubs: Caxton, Brothers of the Book, Lawyers', Pennsylvania Society, American Irish Historical Society, Friendly Sons of St. Patrick. American Geographical Society, National Geographic Society, Ends of the Earth. Residence: The Trees, Ossining, N.Y. Business address: Woolworth Building, New York.

Navarro y Ortiz, D. Benito, Major, Spanish Royal Engineers.—Chief of the Wireless Service of the Army permanent land stations (1918). In 1913 took charge of the Spanish Army Station of Carabanchel EGC (Madrid), until 1918. Decorated by the Spanish Government with the White Military Cross (December, 1919) for his knowledge and merit in wireless matters. One of the most distinguished among the Spanish Royal Engineers in connection with Wireless Telegraphy. Has largely contributed to the wide development of this important scientific branch in Spain.

Nicholls, Lt.-Col. Hon. Frederic, J.P., F.R.C.L. (1911). President Marconi Wireless Telegraph Co. of Canada, Ltd.—B. England, November 23rd, 1856. Educ. Stuttgart, Germany. Went to Canada 1874. Founder of "Canadian Manufacturer," the then Official Organ and Spokesman of the manufacturing interest in Canada, of which he was editor and proprietor until 1893. Consul for Portugal. President Toronto Press Club, 1890. President Athenæum Club, 1893. Life Member Board of Trade. Hon. Member Canadian Press Association. Member Executive Committee, Canadian Manufacturers' Association. Gazetted Hon. Lieut.-Col., October 17th, 1914. Appointed to Senate January 20th, 1917. President and/or Director of many industrial and electrical concerns. Conservative; Anglican. Clubs: Bankers' Club of America, New York; York, Toronto; Albany; Engineer's; etc., etc. Address: 79, St. George Street, Toronto, Ontario, Canada.

Nicholson, Commander Richard Lindsay, D.S.O., late Royal Navy.—Born in London, 1882, educated privately; "Britannia." Entered Royal Navy 1898. Served as wireless officer on the staff of H.M.S. "Vernon," afterwards in the 2nd and 3rd Divisions of the Home Fleet, subsequently being transferred to the 2nd Division under Lord (then Sir John) Jellicoe. Subsequently qualified for the Naval War Staff, and served on the Admiralty Committee (1914) which revised the Naval wireless telegraph and signal books, etc. In July, 1914, was appointed wireless telegraph officer on Lord Jellicoe's staff, and in September of that year was appointed Fleet wireless telegraph officer of the Grand Fleet, vacating this appointment in February, 1917, on being appointed to the Admiralty. While Fleet wireless telegraph officer of the Grand Fleet Commander Nicholson served on the staff of Lord Jellicoe and then on that of Earl Beattie, and devised and introduced an improved form of wireless procedure for use in the Fleet, which was subsequently adopted throughout the Royal Navy and subsequently by the Allied Navies. Present at the battle of Jutland, promoted to Commander R.N., and appointed D.S.O., the wireless telegraph work of the Fleet being specially commended by Lord Jellicoe in his despatches. Appointed Director of Signal Division of the Naval Staff at the Admiralty in 1917, with the rank of Acting Captain, R.N., and retained this appointment until November, 1919. Retired from the R.N. July, 1920. January, 1921, appointed Director of Wireless Telegraphy under the Government, India. During service as Director of Signals at the Admiralty proposed and carried to fruition the formation of the "Wireless Board" and "Imperial Communications Committee." Has always evinced keen interest in Imperial Wireless Communications and constantly urged that an efficient organisation in this repect is an essential and pressing need of the Empire. Officer of the Legion of Honour, Commendatore of the Crown of Italy.

Noble, Sir William, Engineer-in-Chief to the British Post Office.—Commenced his career in Aberdeen Telegraph Office as a telegraphist. In 1893, Engineer for the north-east area of Scotland with headquarters at Aberdeen. In 1897 promoted to Headquarters, London, as First-class Engineer. Subsequently successively Technical Officer, Assistant Superintending Engineer, London, Staff Engineer at Headquarters, Superintending Engineer, London, and in 1912 Assistant Engineer-in-Chief, succeeding to the premier position in June, 1919. In 1919 the King of the Belgians created him a "Chevalier de l'Ordre de la Couronne" for "constant and generous help" during the war,

Knighted June, 1920. Address: General Post Office, London, E.C.

Norman, Major the Rt. Hon. Sir Henry, B.A., F.R.G.S., A.M.I.E.E., 1st Bt. cr. 1915, Kt. cr. 1906, M.P. (L) Blackburn since 1910. Chairman of Imperial Wireless Telegraphy Committee (reported May, 1920).—B. Leicester, September 19th, 1858. Educ. privately in France; Harvard University (B.A.); Leipzig University. Officer of Legion of Honour; Commander of Order of the Saviour; Officer of S.S. "Maurice" and "Lazare," and Crown of Belgium. Assistant Postmaster-General, 1910; Chairman War Office Committee on W/T (1912); Member of Committee on National Telegraphic Research and P.O. Telegraph Organisation Committee; Member of British Association Committee of Radiotelegraphic Investigation and of International Committee of Radiotelegraphic Research; Vice-President of Wireless Society of London; Fellow of Physical Society; Fellow of American Institute of Radio Engineers; Liason Officer with French Government for Military Inventions; Vice-Chairman Imperial Communications Committee, and Chairman of Wireless Sub-Committee. Address: The Corner House, Cowley Street, S.W.1.

Orme, Major Robert, B.A.—B. at Bray (Ireland), October 20th, 1865. Educ. in Irish schools and graduated B.A. at Trinity College, Dublin. Initiated career by taking up Electrical Engineering under Hugh E. Harrison at Hammond College, and then apprenticed to Anglo-American Brush Company. Since 1900 concentrated chiefly on wireless telegraphy and atmospheric electricity. Granted commission in R.F.C., January, 1915, organised and was given command of the Wireless School, Brooklands, November, 1915. Moved himself and his staff from Brooklands to Biggin Hill in September, 1916, where they were constituted first as the Wireless Testing Park and later as the Experimental Establishment, R.F.C. Address: Hollycroft, East End, Newbury, Berks.

Pannill, Charles Jackson.—B. Petersburg, Va., May 13th, 1879. Entered Navy 1898. Chief Telegraphist of United States Coast Signal Service. Entered service of Professor Reginald A. Fessenden, 1902. Conducted experiments in radio communication across Hampton Roads. Installed communication by radio between New York and Philadelphia, 1903. Installed first radio outfit on United States battleship. Conducted experiments between stations of General Electric Company at Lynn and Schenectady; also between Brant Rock, Mass., and Machrihanish Bay, Scotland. Holds commercial first-grade license No. 1. Entered service of United Wireless Telegraph Company as Division Superintendent, 1909. Erected shore radio stations on Great Lakes, later in charge of division south of New York. Entered service of Marconi Wireless Telegraph Company of America, 1912. Superintendent, Southern Division. Entered service of United States Government, 1914, as expert radio aid, Naval Radio Service. Promoted to Assistant to Director Naval Communications in charge of commercial radio service, 1917. Now General Manager, Independent Wireless Telegraph Company, New York. Fellow of the Institute of Radio Engineers. Member Washington Society of Engineers, Member of the Geographical Society.

Parker, J. N.—Representing Indian Post and Telegraph Department in England at the India Stores Depôt, Belvedere Road, London, S.E. Son of the late Major-General N. F. Parker, of the Bengal Army. B. July 6th, 1881, in Calcutta. Educ. Clifton College and the Royal Indian Engineering College, Coopers Hill. Passed out of the latter institution (1902) with diploma of Associate. Joined Indian Government Telegraph Department. Appointed to Electrical Engineer's Office, Calcutta, January, 1904. Accompanied Mr. M. G. Simpson, then Electrical Engineer-in-Chief, to Burma, February, 1904, to assist in preliminary wireless experiments. Continued his connection with the Electrical Engineer's Office and the technical side of telegraph work, which included the erection of several of the 30 kw. Marconi stations belonging to the Department. Superintendent Indian Wireless Telegraph Stations, 1914-19. Represented the Post and Telegraph Department at Poona in connection with the erection of the Imperial Chain Station, until work stopped early in 1915. Address: India Stores Depôt, Belvedere Road, Lambeth, S.E.1.

Pedersen, P. O., Professor in the Royal Technical College, Copenhagen. B. at Sig, near Varde, Jutland, June 19th, 1874. Entered Royal Technical College, Copenhagen (1892). Cand. Polytechnic (1897); Chief Engineer of Telegrafonen, Ltd. (Poulsen Patent), 1899-1902. Gold Medal Danish Society of Sciences (1907). Lecturer at the Royal Technical College, Copenhagen, and Professor from 1912. On board of Dansk Telegrafonfabrik (Danish Telegraphone Co., Ltd.), 1903-12, as well as on Elektroteknisk Forening (Electrotechnic Association) from 1910; Chairman from 1916. President Danish Institute of Civil Engineers, 1902. Director of Det Kontinentale Syndikat for Poulsen Radiotelegrafi (Continental Syndicate for Poulsen Radiotelegraphy) from 1911-19. Member of International Electrotechnical Commision. Fellow Inst. of Radio Engineers since 1915, Fellow Am. Inst. Electrical Engineers since 1920, and a Fellow Royal Danish Academy of Science since 1917. Member of the Telephone Commission (1917), of the Control Committee of licensed Telephone Companies, of the Commission on the training of radio operators, and of the Radio Commission of 1920. His contributions to electro-technical literature have been both important and numerous. Amongst those of recent appearance we may enumerate the following: "Om Poulsen-Buens Teori" (Copenhagen, 1917); "On the Theory of the Poulsen Arc" (*Proc.* Inst. Rad. Eng., New York), 1917 and 1919; "Poulsen-Buens Virkemaade," *Fysisk Tidskrift*, Vol. xvii (Copenhagen, 1918); "Den Elektriske Bues Elektronteori" (*Elektroteknikeren*, Copenhagen, 1917); "The Lichtenberg Figures" (Copenhagen, 1918); and "Townsend's Teori for Stoedionisation" (Copenhagen, 1918). Address: Amalievej 1, Copenhagen, V. Denmark.

Penido, Antonio Nogueira, Director-General of Brazilian Telegraphs (since 1918).—B. September 25th, 1864, at Juiz de Fóra, Minas Geraes. Civil Engineer of the "Escola Polytechnica" of Rio de Janeiro (diploma March, 1886). Was engaged in the construction of the Central Railway of Brazil; the Recife-Caruarú Railway, the Sorocabana Railway; port works of Rio de Janeiro and works at Saneamento of the town of Juiz de Fóra. Successively Engineer of Public Works of the State of São Paulo, Chief of Traffic of the Sorocabana Railway, Chief Engineer of the Itapura-Corumbá Railway, and Inspector-General of the Mogyana Railway.

Péri, T. M., Commandant of Colonial Infantry. Officer of the Legion of Honour. He inaugurated the wireless chain in Indo-China, which comprises fifteen transmitting and receiving and two

direction finding stations. During the war he superintended the construction of the high-power radio station at la Doua (Lyons), and on the 21st September, 1914, secured communication with Russia and later with America. Introduced the first C.W. apparatus for aircraft, employing vacuum tubes of his own invention. Co-inventor of the French valve (patented by Péri and Biguet, and subsequently acquired by the Marconi Company). Inventor in France of the resistance coupled amplifier (patent subsequently acquired by the Société Française Radioéléctrique), of the electrostatic condenser microphone and of apparatus for protecting radio receiving installations from disturbance by atmospherics. Address: Chef du Service, Radio télégraphique de l'Indo-chine, Hanoi, Tong-king.

Petavel, Sir Joseph Ernest, K.B.E., D.Sc., F.R.S., M.I.Mech.E., A.M.Inst.C.E., Director National Physical Laboratory, Teddington.—B. 1873. Educ. University College, London. Scientific Research at the Royal Institution and at the Davy Faraday Laboratory, 1896-98. John Harling Fellow, Owens College, Manchester, 1900-03. Scientific Manager, Low Temperature Exhibit of the British Royal Commission for the St. Louis Exhibition, 1904. Professor of Engineering and Director of the Whitworth Engineering Laboratories, University of Manchester, 1908-19. Publications: Papers in the Philosophical Transactions of the Royal Society, "The Philosophical Magazine," "Engineering," etc. Member of Aeronautical Research Committee and other Government Committees connected with Aviation. Member of Committee on Imperial Wireless Scheme Clubs: Athenæum; Royal Automobile, Primrose Club, London. Address: National Physical Laboratory, Teddington, Middlesex.

Petersen, Hermod.—Chief Engineer and Inspector of Wireless Telegraphy, Norwegian Government Telegraph Department. B. Christiania, 1875. Graduated as electrical engineer at Bergen Technical College, afterwards attending the Polytechnic University at Karlsruhe, Baden. Chief of the Telegraph Schools, 1900-13. One of the pioneers of wireless telegraphic expansion in Norway. Superintended the first radio experiments, 1901. Later on formulated schemes for all wireless land stations along Norwegian coast. Member of the first International Conference on Wireless Telegraphy, Berlin, 1906. Engineer-in-Charge during the erection of a wireless station at Spitzbergen (1911), which communicates with a similar station in the North of Norway. Remained in charge during its first winter. Chief of the Norwegian Wireless Department, 1913. Superintends the land stations. Also Government Wireless Inspector, controlling all the ship stations of Norway. Published a number of technical books for instructional purposes, principally on the subject of telephony and telegraphy, both wired and wireless.

Petit, Gaston Emile.—Electrical Engineer in the French Postes et Télégraphes; Technical Director of the Compagnie Générale de Radiotélégraphie. B. Paris, 1877. Chief of the Service of Wireless Telegraphy at the French Postes et Télégraphes, 1905-11. Member of the International Conference on Wireless Telegraphy, Berlin, 1906.

Pickard, Greenleaf Whittier, A.A.A.S.—Electrical Engineer. B. Portland, Me., February 14th, 1877. Educ. Westbrook Seminary, Lawrence Scientific School, Harvard, and Mass. Institute of Technology. Has made a special study of wireless telegraphy and telephony, and has taken out many United States and foreign patents for wireless inventions, among which are the crystal detector and radio compass. Executed good pioneer work in radiotelephony, and still actively engaged in this branch of the science. Began radio work, 1899, at Blue Hill Observatory, Milton, Mass., under a grant from the Smithsonian Institution. Became associated with Harry Shoemaker, 1901. On the engineering staff of the American Telephone and Telegraph Company, 1902-06. Developed a practical system of radiotelephony, obtaining successful speech transmission without wires, 1902. From 1906 until the present date has been connected with the Wireless Specialty Apparatus Company as consulting engineer. Inventor of a novel method of reducing static interference, which was extensively used by the U.S. Navy for transatlantic reception during the war. Practices extensively as patent expert in wireless patent litigation, and is the author of many papers on radio communication. Fellow of the American Institute of Electrical Engineers. Member of the American Chemical Society. Member of the American Electrochemical Society. Member of the Society of Mechanical Engineers. Member of the American Institute of Mining and Metallurgical Engineers. Member of the American Meteorological Society. Member of the Society of Chemical Industry. Past President and Fellow of the Institute of Radio Engineers. Club: Engineers'. Private address: Newton Centre, Mass. Office address: C and Fargo Streets, Boston, Mass.

Pletts, John St. Vincent.—B. Ryde, I. of W., 1880. Educ. locally and at Central Technical College. Joined Marconi's Wireless Telegraph Company, Ltd., 1899. Constructed wireless stations in Hawaii, Labrador, the Congo, Russia, and the Far East. Deputy Chief of Staff, 1906. Head of that Company's newly formed Patent Department, 1910. Expert in Cryptography at the War Office, 1914. Consulting Engineer, 1919. Member of various scientific societies, and author of a number of technical articles. Address: Marconi House, W.C.2, and Shalston House, Ewell Road, Surbiton.

Poulsen, Valdemar, Eng. D.Sc., D.Ph. (h.c.) Leipzig (1909).—B. Copenhagen, November 23rd, 1869. Studied at University of Copenhagen, 1889-93. Entered technical department Copenhagen Telephone Company, 1893, and for a number of years superintended electrical testing operations. Holds Medal for Merit in gold with crown. Collaborated with Prof. P. O. Pedersen for many years. Member of the board of the Telegrafonen, Ltd. (Poulsen Patent), 1902-16. Joined board of Dansk Telegrafonfabrik, Ltd., 1909, and that of Poulsen Wireless Telephone and Telegraph Company, U.S.A. (1909-11). Fellow of Danish Society of Sciences (1914). Grand Prix at Paris in 1900 for telephone work. Invented in 1903 the arc method of generating continuous electrical waves of wireless frequencies. Danish Society of Sciences' Gold Medal (1907). Publications: "Une Méthode pour Produire des Oscillations non Amortiés et leur Emploi dans la Télégraphie sans Fil": and "La Téléphonie sans Fil: Rapport Officiel au Congrès International des Applications Electriques," Turin, September, 1911 (Copenhagen, 1912). Address: Gentofte Maltegaardsvej 6, Copenhagen.

Prince, Major Charles Edmond, O.B.E. Technical Manager of the Aircraft Department, Marconi's Wireless Telegraph Company, Ltd.—B. Capetown, 1874, son of Rev. E. B. Prince, sometime Vicar of Tor Mohun, Torquay. Educ.

Clifton College (Science Exhibitioner) and Faraday House. Married in 1908 Amelia Ella Verner. Published 1905 "Ode on Poetry and other Poems" (Harrison, Pall Mall). etc. Joined Marconi's Wireless Telegraph Company, Ltd., 1907, specialised in Research Work and particularly in Wireless Telephony. Demonstrated first Marconi Field Station in Italy and Switzerland, 1909. Instituted important improvements in Bellini-Tosi Direction Finding System. Granted commission in Westmorland and Cumberland Yeomanry, 1911. Attached R.F.C., April, 1915. Developed at Brooklands in same year first aircraft wireless telephone. Gazetted experimental officer (First Class), December, 1915. Mentioned in despatches 1918, and in the same year appointed Major. Granted M.B.E. 1918, O.B.E. (Military Division), 1919. Addresses: Stubbings Manor, Burchetts Green, Berks.; 63, Drayton Gardens, London, S.W.

Pupin, Dr. Michael I., Director of Research Laboratory, Columbia University, New York, ex-President, Institute of Radio Engineers.—B. Hungary, October 4th, 1858. Went to the United States 1874. Studied at Colombia University. Graduated 1883. Study continued at Cambridge, England, and Berlin. Returned to the United States. Professor of Mathematical Physics at the Columbia University, 1891. Among his first original work may be mentioned the development of electrical resonance, before the introduction of wireless telegraphy. Patents issued to him on electrical selectivity were licensed to Marconi's Wireless Telegraph Company, 1903. Has worked extensively in the development of his inventions in connection with telephones and telegraphs, and many of his improvements are known by his name throughout the world. Has recently been engaged in the development of a new method of electrical selectivity to be used in connection with wireless telegraphy. Has also been engaged in research work in wireless telephony.

Rego, Capt. T. R. Moraes, Chief of the Radiotelegraphic Service, Brazilian Navy.—B. Rio de Janeiro, March 8th, 1882. Completed training at Naval Academy, 1900. Served for a few years on ships, studying electricity and torpedoes. Torpedo Lieutenant in the Professional Torpedo School. Began studying radiotelegraphy when first wireless stations were installed in Brazilian Navy, 1904. Perfected his knowledge of the subject on special trips to Europe and America. Assistant in the Radio Department of the Navy on various occasions. Appointed (1914) Chief of the Radio Service, a post which he still holds. Address: 22, Ipanema Copacabana, Rio de Janeiro.

Rendahl, R. H.—B. 1878. Electrical engineer in the Royal Swedish Navy Department, 1909; attached to the Swedish Board of Admiralty, 1912; wireless expert attached to the Swedish Navy. Knight of the "Nordstjaerna" Order, and holder of several foreign orders. Address: Djursholms, Ösby, Sweden.

Reoch, Alexander, Wireless engineer, American Marconi Company.—B. Sheffield, England, 1884. Educ. Sheffield Science School and Sheffield University College. Graduated in electrical engineering, 1902, winning the Mappin Medal and Prize in that year. Entered the service of the English Marconi Company in June, 1902, and undertook construction and operating work for that company in England, Holland, Germany, and Egypt. Appointed engineer with the Canadian Marconi Company, 1905. From 1909 to 1911 temporarily in complete charge of the business of the Canadian Marconi Company, during which time the company's contract with the Canadian Government for the operation of the Great Lakes stations was negotiated, as well as the contract between the Canadian Company and the Newfoundland Government. Chief Engineer of the Canadian Marconi Company, 1917, and at the beginning of 1918 he relinquished this position to take an appointment on the engineering staff of the American Marconi Company. Appointed, 1920, Plant Engineer, Radio Corporation of America. Appointed January 1st, 1921, Assistant Chief Engineer Radio Corporation of America. Address: 233, Broadway, New York.

Ribeiro, Alvaro Nunes, Commander and Director, Radiotelegraphic Station of Monsanto.—B. Lisbon, 1879. Educ. National Lyceum and the Lisbon Polytechnic School. Cadet in the Naval School, 1898. Completing his training there, was commissioned to join an expeditionary force to the Zambesi. On his return to Portugal he was appointed naval instructor at the Torpedo and Electrical School, where he devoted himself to the study of wireless. Leading member of the Naval Commission on Organisation, 1910, where he strongly advocated the establishment of a naval staff for war purposes. Member of Parliament. Member of the Commission on Posts and Telegraphs. Secretary to the Naval Commission. As a member of the Posts and Telegraphs Commission he fathered a Bill for the organisation of Portuguese Colonial Wireless, and as soon as the Act had been passed by Parliament a contract to carry out its provisions was concluded with the Marconi Company. Commanded the vessels "Berrio" and "Patrao Lopez" engaged in rescue work, when he met with a serious accident trying to save a cruiser. As a consequence returned to shore service, where he organised the Portuguese Coast Service, and formulated a code of regulations. Address: R. Vieira da Silva 64, Lisbon.

Rinde, K. Werner J., Junr.—B. Falun, 1882. Educ. Falun and Goteborg University. Telegraph clerk, controller, etc. Studied W/T and telephony systems and traffic, during voyages to Holland, Great Britain, Germany, Austria, Italy, and U.S.A. 1912-13 (autumn 1912 for some months with the Marconi Companies in Rotterdam and at sea). Teacher at W/T school of Royal Swedish Telegraph Board from 1914. Supt. of the W/T station at Vaxholm, Sweden, 1914-16, of Karlsborg Radio since beginning of 1917. Address: Karlsborg, Sweden.

Rivers-Moore, H.R., B.Sc., A.C.G.I., A.M.I.C.E., A.M.I.E.E.—Educated at Wellington College and London University. Three years apprenticeship George Clark Ltd., Engineers, Sunderland. Post Office Engineer-in-Chief's Dept. 1907. Delegate to 2nd International Telegraph Conference at Paris 1910. Appointed to Wireless Section of the Post Office December, 1910. In 1913 purchased and carried on the business of the Wilson Apparatus Co., manufacturing transformers, Wilson coils, and other Wireless apparatus. In 1916 this business was taken over by the Indo-European Telegraph Co., Ltd., and associated successively with Messrs. Creed & Co. Ltd., Croydon, and Automatic Telephone Co. Ltd., Liverpool. Appointed in 1918 Asst. Physicist at Admiralty Anti-Submarine Dept., Parkstone Quay, and subsequently given the rank of Hon. Capt. Marines. In 1920 organised the firm of "R. M. Radio Ltd.," undertaking the supply and maintenance of Wireless Equipments of all kinds and is Chairman of this Company.

Robinson, James, M.Sc. (Dunelm), Ph.D. (Göttingen).—B. September 9th, 1884. Studied Mathematics and Physics at Armstrong College, University of Durham and at the University of Göttingen. Pemberton Fellow of Armstrong College, University of Durham, 1906-09. Publications (Physics): Dust Figures in Kundt's Tube (papers in "Physikalische Zeitschrift," Philosophical Magazine, Proceedings of the Physical Sociey of London, between the years 1908 and 1913). Absorption of Cathode Rays in Gases (papers in "Annalen der Physik," "Proceedings" of the Philosophical Society of the University of Durham, in 1910). Photoelectric effect (papers in the "Philosophical Magazine," 1910-15). Papers on Directional Wireless and Reception on Aircraft (in "Radio Review"). Appointments: Armstrong College, Demonstrator in Physics, 1906-07; Lecturer in Mathematics, 1909-10. University of Sheffield, Lecturer and Demonstrator in Physics, 1910-12. East London College, University of London, Lecturer in Physics, 1912-15. Examiner in Physics, University of London, 1912-15. Wireless experience: Commenced in 1915 in the R.N.V.R. as Lieut., R.N.V.R. In 1917 attached R.N.A.S. for experimental W/T work. Various patents. Address: Chief Experimental Officer at the Instrument Design Establishment, Biggin Hill, Kent.

Robison, Samuel S., Rear-Admiral U.S. Navy. Member of the Institute of Radio Engineers.—B. May 10th, 1867. Graduated from the U.S. Naval Academy, 1888. In personal charge of the Division of Radiotelegraphy in the Bureau of Equipment, Navy Department, 1904-06, and in general charge from 1909-11. Author of the "Manual of Wireless Telegraphy for Naval Electricians," first issued in 1906, and revised for several subsequent editions. Address: Boston Navy Yard, Boston, U.S.A.

Rodrigues, Apolinio Gomes da Silva, Flag Captain in the Portuguese Navy.—B. May 31st, 1866. Finished education and entered Portuguese Navy in 1886. Became Professor of Electricity and Torpedoes at the Naval College in 1902, and Professor of Electricity of Naval Auxiliary College, 1903. Received his present rank of Flag Captain in 1907. Entrusted with embodiment of Naval Regulations concerning wireless in 1909. Elected Member of Advisory Committee on wireless in the Portuguese Navy in 1910. Address: Portuguese Admiralty, Lisbon.

Rutherford, Sir Ernest, Kt., F.R.S.—B. New Zealand, 1871. Educ., Nelson College, Canterbury College, Christ Church, New Zealand University, Cambridge University, Langworthy Professor and Director of Physical Laboratories, Manchester University since 1907. Has published many works dealing with the conduction of electricity through gases and radio activity. Address: Manchester University.

Rydin, Sven Ludvig Herman.—Since 1905 Director of Telegraphs in Sweden.—B. Upsala, October 2nd, 1861. Graduated in Law, Upsala, 1885, solicitor's clerk 1887, Registrar in the Lower House 1888-90, Registrar in the Upper House 1890-97. Auditor attached to the Swedish State Railways 1890-97, Registrar attached to the Board of the State Railways 1895-96, assistant to the Director of the State Railways 1896-97, Member of the Board of Telegraphs 1897-1902, Under-Secretary of State for Home Affairs 1902, Grand Commander of the "Nordstjaerna" Order and holder of several foreign decorations. Address: Kungl. Telegrafstyrelsen, Stockholm.

Salmond, Captain J. S. C., R.N.—B. 1881. Entered "Britannia," 1897, left 1898. Served in China in "Barfleur," landed in the Boxer operations, 1900. Mentioned in despatches. Served in Pacific in "Grafton" and "Flora." Qualified as torpedo lieutenant, 1905. Served in Atlantic in "Antrim" as lieutenant (T.). Served in Wireless Telegraphy Experimental Department, "Vernon," 1908-11. Squadron Wireless Telegraphy Officer, 2nd Battle Squadron in "Hercules," 1911. Fleet Wireless Telegraphy Officer, Home Fleet (later Grand Fleet). in "Neptune" and "Iron Duke," 1912-15. Wireless Telegraphy Assistant to D.N.O. Admiralty, 1915-17. In command of "Odin," in Red Sea, 1917-19, mentioned in despatches for operations against Turkish forces in the Asir and Yemen. Serving in Signal Division, Admiralty, on Wireless Telegraphy duties. Member of Radio Research Board. Address: Admiralty, London, S.W.1.

Saltzman, Charles McKinley, Brigadier-General, Executive Officer in the Chief Signalling Office. —B. 1871, State of Iowa. Started business as railway telegraphist and graduated at West Point, 1896. As cavalry officer took part in the Spanish-American War, 1898. Signal officer during the Insurrection in the Philippine Islands. Transferred to the Signal Corps of the U.S. Army, 1901. Since identified with the electrical, cable and radio work, U.S. Army. For a number of years in charge of the Electrical Laboratory of the Signal Corps in Washington, where radio equipment of the U.S. Army is designed and tested. In charge of the radio work of the U.S. Army on the Panama Canal. Represented the United States at the International Radiotelegraphic Conference of London, 1912. Member of the Inter-Departmental Board which prepared regulations for the control of radiotelegraphy in the U.S.A. Address: Office of the Chief Signal Officer, Signal Corps, U.S.A., Washington, D.C.

Sankey, Captain M. P. H. Riall, C.B., C.B.E. R.E. (Ret.).—B. Nenagh, Ireland, 1853. Educ. Switzerland, Royal Military Academy, Woolwich, School of Military Engineering, Chatham. Served in England, at Gibraltar, and as Instructor in Fortification at the Royal Military College, Kingston, Canada. Posted to the British Ordnance Survey, and had charge of the Trigonometrical Division, the Electrotyping Department and the Workshops. Retired from the service (1889) to join the Board of Messrs. Willans and Robinson, Ltd., and (1904) took up consulting work. Shortly afterwards joined the Boards of the Marconi's Wireless Telegraph Company, Limited, and of the Marconi International Marine Communication Company, Limited. Also a Director of several other companies. An accepted authority on thermodynamic problems. Member of the following institutions: Civil Engineers, Mechanical Engineers (President 1920 and 1921), American Mechanical Engineers, Electrical Engineers, Iron and Steel, Naval Architects Junior Engineers, and Gas Engineers. Member of the Governing Board of the National Physical Laboratory and of the Wireless Telegraphy and Gaseous Explosives Committees of the British Association. Served during war as Hon. Engineering Advisor to the Director of Fortifications and Works. Served on the Hon. Valuation Advisory Committee of Experts, dealing with the plant and buildings installed by manufacturing firms for munition purposes. Address: 57, Castle Bar Road, Ealing, W.5.

Sarnoff, David.—B. in Russia, February, 1891. Entered the United States July, 1900. Started

business 1906, and in 1907 received an appointment as Wireless Operator at the Marconi Station located at Siasconset, Nantucket Island, Mass. Served at various ship and shore stations, and eventually became Manager at the Marconi Station at Sea Gate. Has held a number of responsible positions in the service of the Marconi Wireless Telegraph Company of America, being now Commercial Manager of the Radio Corporation of America. Vice-President and Director of the Pan-American Wireless Telegraph and Telephone Company. Secretary of the Institute of Radio Engineers for 1915-1916-1917. Author of a paper on Radio Traffic read before the Institute of Radio Engineers, and a number of other papers on wireless telegraphy. Addresses: 90, Pinehurst Avenue, and 233, Broadway, New York.

Sayeki, Mitsuru, Chief Radio Engineer Installation and Inspection Section of the Direction General of Japanese Posts and Telegraphs since 1908. B. Japan, 1871. Entered Naval College, 1889. Entered the Electric Technical Laboratory in the Ministry of Communications 1895, and has been engaged in the investigation of radiotelegraphy since 1899. He was connected with the "Teishinsho" Radio System, Government and private commercial coast stations and commercial ship stations in Japan. Received prizes and medals for his investigations in radiotelegraphy. Address: 23, Kasumicho, Azabu, Tokyo.

Schledermann, Helmuth Joh. Christian, Electrical Engineer-in-Chief to the Royal Danish Navy. Knight Dannebrog, Knight Norwegian St, Olav.—B. Copenhagen, September 24th, 1876. Educ. Royal Naval Engineering College; Polytechnic Academy of Copenhagen. Further training with electrical firms in foreign countries. Controls the Electrical and Wireless services of the Danish Navy, also Inspector of Danish W/T stations and Electrical and W/T adviser to the Danish Lighthouse Department. Member of the Danish Engineers' Assn., the International Electro-technical Commission and a Commission dealing with erection of a high-power wireless station in Denmark. Publication: A manual on W/T for the Danish Royal Navy. Address: Taffelbays Alle 11, Hellerup, Denmark.

Schwill, Fr., Sub-Director of the International Bureau of the Telegraphic Union at Berne. —B. Strasburg (in Alsace), April 21st, 1875. Started career as Member of the German Post and Telegraph Service. Took part in the International Radiotelegraphic Conference at Berlin in 1906, at the close of which he was appointed by the Swiss Federal Government to the International Bureau of the Telegraphic Union to organise and supervise the new Radiotelegraphic Section established by the Berlin Conference. Address: Bureau International de L'Union Télégraphique, Berne.

Scott-Taggart, John, Educ. Technical establishments and King's College, London. Two years departmental Manager and Research Engineer, Radio Communication Co., Ltd. Acts as patent adviser to C. F. Elwell, Ltd., and Mullard Radio Valve Co., Ltd., and in a technical advisory capacity to other concerns. Some time in charge of valve design and construction at Ediswan Lamp Works. Served 1914-1919; some time Instructor of Wireless to 1st Army, but chiefly Wireless Officer to various units. Mentioned in Despatches and later awarded Military Cross. Author of various papers before British Association and other Societies, and of over fifty articles; also the volume "Thermionic Tubes in Radiotelegraphy and Telephony." He is a Fellow of the Institute of Physics and holds membership in the Physical Society and the British, American, and French Institutions of Electrical Engineers; also President of two wireless societies and committee member of Wireless Society of London. Has produced several inventions of commercial importance, particularly in connection with Thermionic Valves. Address: 6, Beattyville Gardens, Ilford.

Shaughnessy, Edward H., O.B.E., M.I.E.E. M.I.RadioE.—B. 1871. Engineer in charge wireless section, Engineering Department, British Post Office. Entered Post Office Engineering Department, 1896, served in experimental, testing, telegraph, and cable sections, specialising on underground and submarine cables. Served as a cable engineer (1895) on s.s. "Faraday," during the laying of a sub marine cable in Gulf of Mexico, and the repair of other cables. After five years in the provinces on construction and maintenance work returned to London (1913) to take up present position. For many years lectured on telegraphy, telephony, etc., at various London Technical Institutes. Member of the Radio Research Board. Post Office representative on Committee of Wireless Section, Institution of Electrical Engineers. Vice-President, Wireless Society of London. Examiner in Telegraphy for the City and Guilds of London Institute. Member of some committees and panels of the British Engineering, Standards Association. Address: Engineering Department, General Post Office, London.

Shoenberg, I.—B. 1880. Graduated at the Polytechnical Institute of Kieff. In 1905 joined the Russian Marconi Company on the day of its inauguration, being appointed Chief Engineer. Held this post until 1914, when he left Russia for England, joining Marconi's Wireless Telegraph Company in the capacity of Consulting Engineer. Since 1919 engaged as Chief of Patent Department. Address: Marconi House, Strand, W.C.2.

Simpson, Lt.-Col. Adrian F.R.S., C.M.G., A.M.I.E.E. (late) R.E.—B. Edinburgh, 1880. Educ. in his native city, and at Clifton and the Royal Military College, Sandhurst. Commissioned in His Majesty's Forces, 1900. Served in India, being transferred to the Regular Indian Army. Visited Russia 1903-5 for linguistic study. Becoming interested in wireless telegraphy, left the Army and started work with the English De Forest Wireless Telegraph Syndicate. His connection with Marconi's Wireless Telegraph Company commenced with his joining the Field Station Department. On the formation of the Russian Company of Wireless Telegraphs and Telephones, 1908, appointed managing director of that company. During the war served in Russia and at the War Office. Late Director of Wireless Telegraphy under the Government of India. Director and Joint General Manager Marconi Wireless and International Companies. Chevalier of Order of St. Anne, 3rd Degree, and of Order of S. Stanislas, 2nd Degree, with Crossed Swords.

Sins, Ernest.—B. 1859, Besançon, where he received his early education. Joined the Ecole Polytechnique, and began his career by enrolling in the Corps of Telegraph Engineers. Participated in the organisation of the telegraphic and telephonic systems in Tunisia. Received an appointment in the Central Office of Posts and Telegraphs, Paris, 1892, where he ultimately rose to the position of Telegraph Engineer-in-Chief. Chief of the

Correspondence Department of International Telegraphy, 1899, and took special interest in wireless telegraphy. Repesented his country at the International Conferences on Radiotelegraphy held at Berlin, 1903, and acted as Secretary to the Commission appointed by the latter Conference for drawing up regulations. Sub-Director of the French Telegraphic Department, 1911, but resigned from the public service in the same year in order to be at liberty to take part in the development of wireless industry. One of the founders and directors of the Compagnie Générale Radiotélégraphique, and was afterwards managing director to the Compagnie Universelle de Télégraphie et de Téléphonie sans Fil. Since the beginning of 1918, general manager of the Compagnie Générale de Télégraphie sans Fil.

Slee, Commander J. A., C.B.E., R.N. (Ret.)—B. May, 1878, Wimbledon. Educ. on training ship "Britannia." First appointment as midshipman was to H.M.S. "Centurion," on which vessel he sailed for China, 1894, being transferred, three years later, to the brig "Nautilus" for sailing experience. Passed for his lieutenant's commission, obtaining four firsts out of a possible five. After service on the "Decoy," "Ernest," "Anson," and "Severn," qualified as Torpedo Lieutenant, and spent a year on the staff of the "Defiance" at Devonport, where he gained his first wireless experience, 1901. Whilst attached to H.M.S. "Queen," 1906, eyesight trouble developed and he was obliged to transfer to shore service. For two years after quitting the sea he served as one of the Wireless Telegraph Experimental Officers on the "Vernon" at Portsmouth, and from 1908 until 1919 was in charge of all shore wireless and war signal stations in Great Britain. Promoted Acting Commander, 1913 Acting Captain, 1918. On the formation of the Wireless Board, Captain Slee was appointed its chief. Awarded an O.B.E., January, 1919, C.B.E., April, 1919. Retired from the Navy due to the eyesight trouble mentioned above, December 1st, 1919, with the rank of Commander. Joined the Marconi International Marine Communication Co. as Technical Superintendent and Adviser, January, 1st, 1920. Appointed Technical Manager, M.I.M.C. Co., Ltd., June, 1921. Address: 7, Elvaston Place, London.

Smith-Rose, Reginald Leslie, B.Sc., D.I.C., A.R.C.S., A.M.I.E.E.—Educ. Imperial College of Science and Technology: (*a*) Royal College of Science, 1912-14; (*b*) City and Guilds (Engineering) College, 1914-15. Diplomas: Bachelor of Science, London, First-class Honours; Royal Scholar, Physics, First Place: Associate of Royal College of Science (A.R.C.S.), Class 1, Physics Prizeman. Diplomée of the Imperial College (D.I.C.) for Research Work in Wireless Telegraphy at the City and Guilds (Engineering) College. Practical experience with Messrs. Siemens Bros., Woolwich, from 1915-19; engaged on experimental work in connection with Military, Manual and Automatic Telephones; and latterly with Thermionic Valve Amplifiers for Telephone Lines and Wireless Receiving sets. Now an Assistant at the National Physical Laboratory, engaged on research on Thermionic Vacuum Tubes and general wireless work. Member of Sub-Committee "D" on Thermionic Valves, of the Radio Research Board of the Department of Scientific and Industrial Research. Physicist-in-Charge of Directional Wireless Research under Sub-Committee "C" of the Radio Research Board. Senior Lecturer in Wireless Telegraphy and Telephony at the Polytechnic, Regent Street, W. Past Chairman and Hon. Secretary of the Students' Section of the Institution of Electrical Engineers. Author of various scientific papers. Address: National Physical Laboratory, Teddington.

Smith, Tom Vincent, Major, M.C., M.I.E.E.—B. 1872 in West Dulwich, London. Joined the Amalgamated Radio Telegraph Company in 1906 Director of the British Radio Telegraph Company. Consulting engineer until outbreak of War. Served on the Civil Aerial Transport Committee, and the Wireless Committee of the Institution of Electrical Engineers. President of the National Association of Supervising Electricians. Papers before the Royal Artillery Institution at Woolwich on "The Co-operation of Aeroplanes with Artillery," and before the British Association on "Aircraft Wireless during War." War Services: Joined No. 1 Reserve Air Squadron at Farnborough, January, 1915. No. 7 Squadron in France, February, 1915. Wireless Officer to No. 3 Squadron in March, and to the 1st Wing in May, 1915. R.F.C. General Headquarters in March, 1916, in charge of R.F.C. Wireless on the Western Front. 1917, Officer-in-Charge of Wireless at the Air Ministry for all theatres of War. 1918, Wireless Officer to the Independent Air Force until end of War. Decorations: Military Cross, Knight of the Military Order of Savoy, 1914-15 Star, General Service Medal, Victory Medal with oak leaves, King Edward's Coronation Medal, twice mentioned in despatches. Address: Royal Thames Yacht Club 80, Piccadilly, W.1.

Snell, Sir John Francis Cleverton, Kt. (Cr. 1914), M.Inst.C.E.—Chairman, Water-Power Resources Committee of the Board of Trade, and was a member of the Imperial Wireless Telegraphy Committee. Past President of the Institution of Electrical Engineers, Fellow of the American Institute of Electrical Engineers. Member of the Advisory Council for Scientific and Industrial Research and a member of many other scientific societies. Formerly partner of Preece, Cardew, Snell and Rider, Consulting Engineers. Now Chief Electricity Commissioner under the "Electricity (Supply) Act, 1919." B. at Saltash, Cornwall, December 15th, 1869. Educ. Plymouth Grammar School and King's College, London. After service (1883) with Woodhouse and Rawson, and (1889) with Crompton & Co., appointed resident Engineer for the late General Webber, C.B., R.E., at South Kensington, and subsequently became the General's Chief Assistant. Appointed Borough Electrical and Tramways Engineer, Sunderland, August, 1896. In 1906 started practice as Consulting Engineer, Westminster, first with Mr. S. S. Moore Ede and afterwards amalgamating with Preece, Cardew, Snell and Rider in 1910. Acted as principal technical witness for the Crown in the arbitration proceedings of the National Telephone Company, 1912. In 1917 appointed Member of the Electric Power Supply Committee of the Board of Trade, and in 1919 Chief Electricity Commissioner (Designate), in which capacity he undertook the piloting of the "Electricity (Supply) Bill" through both Houses of Parliament. To fill this capacity he resigned his consulting practice and position in his late firm. Address: Wey Barton, Byfleet, Surrey.

Solari, Marquis Luigi.—Cavaliere Ufficiale della Corona d'Italia, Cavaliere dei SS. Maurizio e Lazzaro, Commendatore of Danilo, and Cavaliere of St Anna. Received decorations of bronze medals for the campaigns of China and Africa. —B. in Turin. Was appointed officer of the

Italian Royal Navy in 1890. Obtained the diploma of Electrical Engineer at the University of Turin in 1898. In 1900 placed in charge of the Laboratory of Wireless Telegraphy at the Royal Dockyard of Spezia. In 1902 took charge of the wireless telegraph station on the Italian warship "Carlo Alberto" during the historic experiments on that vessel conducted by Senatore Marconi. In 1903 delegate of the Italian Government to the Berlin Wireless Conference. In 1904-05 supervised the Wireless Telegraph Department of the Italian Ministry of Posts and Telegraphs. Official delegate of the Italian Government at the International Congress of Electricity held at St. Louis, U.S.A., in 1904. Joint inventor with Professor Lori, of the Padua University, of a magnetic relay. Has published several papers on wireless telegraphy in various periodicals and reviews. Since 1906 has devoted himself to the development of the Marconi system in Italy. Address: Via Maria Adelaide, 8, Rome (Italy).

Squier, Major-General Sir George Owen, K.C.M.G., Ph.D.—Chief Signal Officer U.S. Army. Formerly millitary attaché to the American Embassy in London. Educ. Johns Hopkins University, Baltimore. Grad. Doctor of Physics 1893. Research student under the late Professor Rowland and in the laboratory of the late Sir William Preece at the British General Post Office. Discovered the use of living trees as a means of receiving wireless messages 1904, and published a paper entitled "The Absorption of Electro-Magnetic Waves by Living Vegetable Organisms." On June 28th, 1911, an important treatise by him, dealing with multiplex telephony and telegraphy by means of waves guided by wires, was read before the American Institute of Electrical Engineers. Author of numerous papers on the subject of wireless telegraphy and has devoted special attention to the use of wireless telegraphy in military operations. Awarded the Elliott Cresson Gold Medal for his researches in multiplex telephony, 1912. Presented a paper on "Cable Telegraphy" to the Physical Society of London, June, 1915, advocating the adaptation of Wireless Engineering methods to ocean cables. Author of "Tree Telephony and Telegraphy," "Multiplex Telephony and Telegraphy over Open-circuit Bare Wires Laid in the Earth or Sea," etc. Member of National Academy of Sciences, 1919. Awarded the Franklin Medal, by the Franklin Institute of Philadelphia, Pa., 1919. Awarded the Distinguished Service Medal, United States Army, 1919. Representative of War and State Departments, at the Conference of Interallied Radio Technical Committee, at Paris, France, June-September, 1921. Address: War Department, Washington, D.C., U.S.A.

Stanley, Rupert, Principal Municipal College of Technology, Belfast. Chevalier of the Legion of Honour.—B. in Ireland, 1876. Educ. Irish schools and universities. Joined technical staff of the Isle of Thanet Electrical Light and Power Company in 1899, and two years later appointed Lecturer in Physics and Electrical Engineering at the Brighton School of Science and Technology. Returned to Belfast in 1903 as Professor of Physics and Electricity at Belfast Municipal Institute. Member of the Institution of Electrical Engineers. In 1914 undertook the preparation of a "Text-book of Wireless Telegraphy," which has become a standard text book on the subject, both at home and in America, and is now published in two volumes, of which the second deals exclusively with valves and valve apparatus. Started war service as second in command of a Field Company in the Ulster Division, but was soon transferred to radio-telegraph work, and served in France from October, 1915, to April, 1918, where he became Chief Wireless Instructor to the B.E.F. Address: Municipal College of Technology, Belfast.

Stone Stone, John.—Studied electricity, chemistry, physics and mathematics at Columbia University and Johns Hopkins University. Experimentalist in research laboratory, American Bell Telephone Company, 1890-99. Made some investigations in telephony without wires, 1892. Consulting Electrical Engineer and expert for the Ladd Wireless Telephone Syndicate, experimenting on directional signalling, 1899. Retained in 1900 by the Stone Wireless Telephone Syndicate, and in 1902 when the Stone Telegraph and Telephone Company was organised. Author of many scientific papers on wireless. Granted more than 100 U.S. patents in the radio field and a correspondingly large number of foreign patents. Fellow, American Academy of Arts and Sciences. Fellow, American Association for the Advancement of Science, Fellow and Past-President Institute of Radio Engineers. Member or Associate of the following Societies: American Institute of Electrical Engineers; American Electro-Chemical Society; U.S. Navy Institute; Franklin Institute; Mathematics and Physics Club; Boston Scientific Society. His investigations have been principally directed along the lines of eliminating interference in wireless telegraphy.

Swinburne, James, F.R.S.—B. Inverness, February 28th, 1858. Educ. Clifton College. Employed by Messrs. J. W. Swan and Co. (1881) to organise their lamp factory in Paris; later he went on a similar mission to America. Consulting Engineer since 1894, and has attained considerable eminence in various branches of science. As an expert on wireless telegraphy his fame has been recognised by the Government. Member of the Technical Committees considering the Imperial Wireless Scheme, 1912 and 1919-20. Member of various scientific societies, and is on the Council of some. President of the Institution of Electrical Engineers, 1902-3. Addresses: 82, Victoria Street, S.W.1; Woodhurst, Oxted, Surrey.

Swinton, Alan A. Campbell, F.R.S., M.Inst.C.E., M.I.E.E., M.I.M.E., Past-President of the Wireless Society of London.—B. Scotland, 1863. Opened career in 1882 at the Armstrong Works, Elswick. Consulting electrical engineer in London since 1887, having been responsible for the carrying out of many large electrical installations. Chairman of Crompton & Co., Ltd., and director of several electricity supply and engineering manufacturing companies. Associated with the development of the Parsons turbine and other important inventions. Chairman of the Council of the Royal Society of Arts; Chairman of the British Scientific Instruments Research Association; a Member of the Executive Committee of the Board of the National Physical Laboratory; Past President of the Röntgen Society. Member of the Executive Committee of British Science Guild; a Manager of the R. Institution of Great Britain (1912-15). Member of Sub-committee "B" on Atmospherics of Radio Research Board of the Department of Scientific and Industrial Research. Has devoted considerable attention to scientific research, including wireless telegraphy. Address: 66, Victoria Street, Westminster, S.W.1.

Tafur, D. Jose, Col., Spanish Royal Engineers, Director of the Centro Electrotécnico y de Comunicaciones, Madrid. Has the full control of the Wireless Services in the Spanish Army

A member of the Spanish permanent Radiotelegraph Commission. One of the chief contributors of military as well as civil wireless in Spain.

Tesla, Nikola.—B. Smiljan, Sika, Dalmatia, 1857. One of the foremost of the world's electricians. Quite early in life he began to take delight in arithmetic and physics. Graduated Carlstatt, 1873. Devoted his energy to electrical studies and investigations. Went to Gratz, where, at the Polytechnic School, he prepared for work as professor in mathematics and physics. Whilst there he was so struck with the objections to the use of commutators and brushes that he made up his mind to remedy that defect in dynamo-electric machines. Visited America about 1882, where he captured the attention of the whole world with his fascinating experiments on high-frequency electric currents. Since 1890 devoted himself almost entirely to studies of alternating currents of high frequency and very high potentials.

Thoernblad, Thor, Lieut., R. Swedish Engineers.—B. Upsala, Sweden, June 10th, 1885. Pioneer of Wireless Telegraphy in Sweden. His interest in the theory and practice of wireless dates from 1899. Author of the first great Swedish standard work on Wireless Telegraphy, "Traadloes Telegrafi," published 1911. Passed his examination as student at the High School of Stockholm, 1904. Entered the Royal Engineers as Cadet, 1904. Commissioned 1906. Studied mathematics, physics and chemistry 1906-10, first at the Technological Academy of Stockholm, later at the University of Stockholm. By command of the Swedish Government studied Wireless Telegraphy in foreign countries. Devoted considerable attention to the use of wireless on aircraft. Author of a number of articles on radiotelegraphy in the scientific and daily press. Knight of the Order of the Crown of Italy. Address: Strandvägen 7, Stockholm.

Thomson, Sir Joseph John, Kt., O.M., D.Sc. Oxon.(hon.), Dublin, Victoria and Columbia (N.Y.), F.R.S., etc.—B. near Manchester, 1856. Educ., Owen's College; Trinity College, Cambridge. Master of Trinity College, Cambridge, since 1918; Cavendish Professor of Physics, Cambridge, 1884-1918. Has published numerous works, including "Recent Researches in Electricity and Magnetism," 1895; "Discharge of Electricity through Gases," 1897; "Conduction of Electricity through Gases," 1903. Address Trinity College, Cambridge.

Todd, David Wooster, Captain, U.S. Navy, At present Aide to the Commandant, Navy Yard, New York.—B. Round Valley, California, June 29th 1874. Educ. private and public schools in Mich., Nev., and San Francisco. Appointed to Naval Academy, 1891, graduated in June, 1895. Has served at sea on the following vessels of the United States Navy: "Constellation," "Monongahela," "Olympia," "Oregon," "Wheeling," "Rainbow," "Chicago," "Iowa," "Newark," "Denver," "Monterey," "Concord," "Galveston," "Wyoming," "Dixie," and in command of the "Pittsburgh," flagship in European waters; has served ashore as instructor in ordnance, Naval Academy; in charge of Radio Division of Bureau of Steam Engineering, Navy Department, and as Assistant Superintendent of the Radio Service. Attended International Radiotelegraphic Conference, London, 1912, as a delegate. Director Naval Communications, August 3rd, 1916, succeeding Capt. (now Rear-Admiral) W. H. G. Bullard, U.S. Navy. Attended Inter-Allied Radio Conference in Paris upon United States entry into European War, and subsequently organised the American end of the Inter-Allied Transatlantic Radio System. Also organised and directed the United States Cable Censorship, and served on the Censorship Board as Chief Cable Censor. Address: Navy Yard, New York.

Torikata, Dr. Wichi.—B. Japan, 1883. Trained to the profession of Electrical Engineering in the Engineering College of Tokyo Imperial University. Graduated 1906. Devoted himself to the close study of Radiotelegraphy and Telephony, acting at one time as Assistant Engineer to Dr. Osuke Asano, ex-Director of the Electro-Technical Laboratory, and also as Chief Engineer of the wireless section. Inventor and patentee of the Koseki or Mineral Detectors, the T.Y.K. Oscillation Gap for use in Radiotelephony, and the Wave Telephony superposed on electric power transmission line. The late Mikado of Japan recognised his services by awarding him the Fifth Degree of Decoration, bestowing this honour specifically for his services in connection with Wireless Detectors, whilst the Ruling Emperor has presented him with the Fourth Degree of Decoration on account of his Radio Researches. The Senate of Tokyo University marked their appreciation of his efforts by bestowing upon him in 1915 the title of "Dr. Engineer." Has received many prizes for technical work, including the First Medal of the Japanese Electric Engineers' Society (established 1888), and Academy Prize and Medal granted by the Japanese Imperial Academy. He took his position after the resignation of Dr. M. Tonegawa, ex-Director. Address: No. 2801 Sanno, Omori, near Tokyo.

Travailleur, Maurice.—B. Brussels, 1871. Graduated as engineer at Brussels University, 1893. Appointed Electrical Engineer to the late King of the Belgians, 1897. One of the founders of Internationale Société Anonyme, the Marconi International Marine Communication Co., Ltd. Managing Director of the Société Anonyme Internationale de Télégraphie sans Fil, and Chairman of the Société Nationale Radio-électrique, both in Brussels.

Tsiang Tseng-yi.—Native of the Haining District of the Chekiang Province. Acquired the third degree of Literature at the Metropolitan Examination in Peking, 1904, and appointed Junior Clerk of the Board of Revenues. Soon afterwards transferred in the same rank to the Board of Communications (then known as Yuchuanpu) by its special recommendation for dealing with telegraph matters. Chinese telegraphs were then administered partly by a commercial company and partly by the provincial viceroys and governors. Mr. Tsiang proposed that all the commercially and provincially owned telegraph lines be nationalised and placed under the direct control of the Yuchuanpu. This proposal received the approval of the Government, and was put into operation. In 1911, as Commissioner of Telegraphs of the Yuchuanpu, he caused two powerful radio stations to be established, one in Peking and the other at Nankin. Since their establishment the wireless service has been greatly improved and extended to such localities as Shanghai, Woosung, Foochow, and Canton, along the coasts, and Kalgan and Wuchang in the interior. Both the Ministries of War and Navy have followed in the steps of the Ministry of Communications by installing radio stations for their respective purposes. Mr. Tsiang served over ten years in the telegraph service, holding the following important positions:

1910-11, Commissioner of Telegraphs of the Yuchuanpu; 1913-16, Chief of the Financial Department of Telegraphs, Posts and Navigation. Acted as Chief of the Telegraph Department and Director-General of Telegraphs of the Ministry of Communications, and Chairman of the Chinese Society of Electrical Science.

Turner, Laurence Beddome, M.A., M.I.E.E.—B. 1886. Educ. Bedford Grammar School and King's College, Cambridge (1904). First-class honours in Mechanical Sciences Tripos in 1907. Spent 1907-08 in research work at the C.U. Engineering Laboratory, receiving in 1908 the award of the University "John Winbolt Prize" for an essay on this research. After a year in the workshops and drawing office of Messrs. Siemens Bros. at Woolwich and Siemens u. Halske A.G. at Berlin, entered in 1910 the Engineer-in-Chief's office of the G.P.O. Engaged there in W/T experimental work, and in the design and installation of new ship-and-shore stations. Attached to the Army Signals Experimental Establishment at Woolwich 1916, where he designed wireless field apparatus, including the Infantry "Loop Set." Fellow and Lecturer of King's College, Cambridge, 1919. Member of the Imperial Wireless Telegraphy Committee, 1919. Author of "Outline of Wireless," 1921. Address: King's College, Cambridge.

Turner, Samuel, A.M.I.E.E., A.F.Ac.S., A.F.Aer.S., M.I.Radio.E.—Educ. Barrow-in-Furness Sec. and Tech. Coll., under G. Grace, D.Sc., etc. Two years' works training at Messrs. Vickers, Maxim, Barrow. Appointed to post in Telephone Research Labs., London. Subjects included Telephony and Telegraphy, Valves and Valve Circuits, Telephone Transmission, High-Frequency Measurements, Automatic Telephony, etc. Lecturer and Instructor to R.F.C. W/T Officers at Brooklands (under Major Prince) in W/Telegraphy and Telephony applied to Aircraft December, 1915—Oct., 1917. Research work in W/Telephony, C.W., etc. (using Triode valves) at R.F.C. W/T Exper. Station, Biggin Hill and Woolwich (1917-18). Transferred to Air Ministry to develop and supervise Technical Section. Resumed civilian research work July, 1919. Inventions: Devices for W/Target Training of Pilots, Observers, etc. Publications: Papers (London Telephone Society). Articles: "Electrician" (and other papers), and I.C.S.; Textbook on Automatic Telephony, etc. Address: 31, Belsize Square, N.W.3.

Turpain, Professor Albert.—B. La Rochelle, December 2nd, 1867. Employed in the Department of Posts and Telegraphs of France, 1884-87. Licentiate in physical science, 1888. Licentiate in mathematics, 1891. Obtained doctorate of science, 1889. As tutor of physics at the Faculty of Science, Bordeaux, succeeded in sending messages without wires from an equipment erected in the college buildings. Has experimented in wireless telegraphy with successful results for many years. Applied himself to the question of tuning and (1899) experimented with a means for determining the direction of electro-magnetic waves. Resumed these experiments 1912. Succeeded in obtaining graphic records of time signals by means of a micro-amperemeter over a distance of 300 km. between Poitiers and Paris, 1911. Carried out successful experiments in photographically recording wireless telegraph signals which passed between Paris and Poitiers.

Vallauri, Giancarlo.—B. Rome, 1882. Educ. in the classical schools of Italy. Entered the Royal Naval Academy. Appointed officer of the Royal Italian Navy, 1903. After a few years at sea he quitted the active naval service and joined the Polytechnic School in Naples, obtaining the diploma of engineer and the electrotechnic diploma, 1907. Since conducted electrical tuition in the Polytechnic Schools of Padua, Karlsruhe and Naples. Connected with many industrial electric establishments and placed his services at the disposal of the Royal Navy for the installation of wireless stations. Inaugurated at the Polytechnic School in Naples a course in Wireless Telegraphy 1912, and supervised that subject till the end of 1916, with an interruption for service at sea during the first two years of the great war, when he was called to the direction of the Institute of Electricity and Wireless Telegraphy of the Royal Navy by the Royal Naval Academy in Leghorn. His attention has mainly been turned to the study of ferro-magnetic phenomena, to which he has made important contributions. Has published a series of papers on Ionic Valves, and on radiation measurements, which has won wide publicity and appreciation. Address: R. Accademia Navale, Leghorn, Italy.

Van der Bijl, Dr. H. J.—Scientific and Technical Adviser Bureau of Mines and Industries, Union of South Africa. Educ. Victoria College, British South Africa, and University of Leipsic, where he gained his doctorate. Visited United States, 1913, and joined Engineering Department, Western Electric Company. Instrumental in devising several improvements in Telephone and Telegraph instruments. Figured prominently in the development of the Vacuum Tube, and ranks among the leading authorities on thermionics. Address: Scientific and Technical Adviser, Bureau of Mines and Industries, Pretoria, S.A.

Van der Pol, Balth, Jun., D.Sc., Director of Physical Research Laboratory, Teyler's Institute (Haarlem).—B. January 27th, 1889, at Utrecht (Holland). Educ. at Utrecht, graduating as *Candidaat* in the University (1914), and as *Doctorandus* (1916). Studied Experimental and Theoretical Physics, under Professors Julius and Ornstein. His interest in the theory and practice of wireless dates from 1904. Came to England in 1916 to study under Professor J. A. Fleming. Proceeded to Cambridge in 1917, working under Professor Sir J. J. Thomson, at the Cavendish Laboratory for about eighteen months. He is author of a number of valuable monographs upon physical and radiotelegraphic subjects. Appointed Conservator and placed in charge of the physical research laboratory of Teyler's Institute, Haarlem (Holland). In April, 1920, he took his doctor of science degree at the Utrecht University *cum laude* on a thesis on the propagation of electro-magnetic waves through an ionised gas. He is one of the founders of the Dutch Radio Institute, of which society he is vice-president. He is now engaged on research work in the above mentioned laboratory with Professor H. A. Lorentz. Address: Physical Laboratory, Teyler's Institute, Haarlem, Holland.

Vanni, Dr. Giuseppe.—B. Albano Laziale (Rome) in 1862. Graduated in science 1887. Went to Strassburg 1890, where, under Professor Kohlrausch, of the Physical Institute, he studied electrical measurements. Appointed to teach physics at the Collegio Romano, Rome, 1894. Nominated professor and director of the physical laboratory of the Military Radiotelegraphic Institute in Rome, 1912. Took part in the International Radiotelegraphic Conference of London, 1912, as a member of the Italian delegation, and also at the Conferences held in Paris in

1912 and 1913. His works are principally concerned with electrology, electrical engineering, and electrical waves. By means of an hydraulic microphone of his invention made interesting experiments in wireless telephony between Rome and Tripoli (1,000 km.) and between Rome and Treviso (420 km.), and in 1914 his paper on the "Progress and Actual State of Wireless Telegraphy and Telephony" gained the Cagnola Prize of the Royal Lombard Institute of Science and Literature in Milan. Address: Rome, Military Radiotelegraphic Institute, Viale Mazzini 10.

Vyvyan, R. N.—Educ. at Charterhouse. Received electrical and engineering training Faraday House. Joined Marconi's Wireless Telegraph Co., 1900. Built Poldhu Wireless Station, subsequently proceeding to Canada as Managing Engineer until 1908. In the course of his work visited most European countries and also South Africa and America. Responsible for design and construction of most of the high-power stations erected by the Marconi Company, including naval strategic stations and others erected for the Admiralty early in the late war. Joined R.F.C., 1916, and served in France. Later sent to America as member of the British War Mission. Demobilised early 1919, since when Superintending Engineer of the Marconi Company. In charge of the design, construction and management of all wireless stations owned or erected by that company. Address: Marconi House, Strand, W.C.2.

Wade, C. F. Newton, A.M.I.Rad.E., Postmaster-General and Superintendent of Land and Radio Telegraphs, British North Borneo.—B. Shepton Mallet, Somerset. Five years with Messrs. Siemens Bros. & Co., at Woolwich, as Radio Engineer, during which time he was employed on extensive experiments on earth telegraphy, earthed and buried aerials and transmission of high-frequency currents along wires, in addition to ordinary experimental, designing and testing work in connection with Radio apparatus. Superintendent of Government Radiotelegraphs, British North Borneo, 1918. Postmaster-General and Superintendent of Land Telegraphs in addition in January, 1920. Address: Jesselton, British North Borneo, and Intake, Sheffield, Yorks.

Walter, L. H., M.A., A.M.I.E.E.—B. London, 1870. Educ. private schools in England, at Hanover, Germany, Trinity College, Cambridge (1894-98), where he took honours in Natural Sciences. Later carried out research work in the University Engineering Laboratory. Experimental assistant to Sir Hiram S. Maxim. Editor of "Science Abstracts," 1903, when that publication was taken over by the Institution of Electrical Engineers, which position he still holds. Author of "Direction and Position Finding" (Pitman), 1921. Inventor of several forms of detectors of electrical oscillations, and for his magnetic type of oscillation galvanometer was awarded the John Scott Medal. In 1905 he drew attention to the advantages of directive wireless telegraphy and, associating himself with Captain Tosi and Dr. Bellini, he introduced the directive system and the wireless compass into England. Address: Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2, and 23, Park Mansions, Battersea Park, S.W.11.

Weagant, Roy A.—B. Morrisburg, Ontario, Canada, 1881. Educ. Stanstead College, Stanstead, Quebec, Canada, and McGill University, Montreal, Canada. Graduated from Electrical Engineering Course, 1905. Studied Physics under Sir Ernest Rutherford and first became interested in wireless through witnessing some of his experiments in Hertzian waves. Gained engineering experience with the Montreal Light, Heat, and Power Company, the Westinghouse Electric Manufacturing Company of Pittsburg, Pa., and the De Laval Steam Turbine Company. Took up commercial wireless work in 1908. Entered service of the Marconi Wireless Telegraph Company of America, 1912, where he soon rose to the position of Chief Engineer. Appointed, 1920, Consulting Engineer, Radio Corporation of America. Fellow of the Institute of Radio Engineers and former member of its Board of Directors and Standardisation Committee. Inventor of a novel method of eliminating static interference. Awarded Liebmann Memorial Prize for 1920. Address: Douglas Manor, Long Island, New York.

Whiddington, Richard, M.A., D.Sc., Professor of Physics, University of Leeds.—B. November 25th, 1885, in London. Educ. at St. John's College, Cambridge, where after taking degree in 1908, he undertook research work under Professor Sir J. J. Thomson at the Cavendish Laboratory. Elected Fellow of St. John's College, 1911. In September, 1914, went to Royal Aircraft Factory, Farnborough, to design aircraft wireless apparatus for the Flying Corps. Received first commission in Army in 1915, leaving Farnborough soon after. During the war designed a number of the standard R.A.F. wireless sets and assisted on the W/T Board and Inter-Allied W/T Commission in Paris. Demobilised with rank of major, June, 1919. Has published a number of original papers on various electrical subjects. Member of Sub-Committee "D" on Thermionic Valves, of Radio Research Board, of the Department of Scientific and Industrial Research. Address: Leeds University.

Whitmore, G. Scovell.—B. Dawlish, 1881. Educ. St. Andrew's College, Dublin. Served under Eastern Telegraph Company, Ltd., at Porthcurnow and Malta cable stations. Entered Heaton works of Sir C. A. Parsons & Co., 1902, and became Chief Assistant to the Engr. and Gen. Manager of Northern Counties Electricity Supply Co., Ltd., in 1906. Joined the engineering staff of Marconi's Wireless Telegraph Co., Ltd (1909), and appointed (1910) Managing Engr. at the Transatlantic W/T Station, Glace Bay, Canada. Since 1912 employed at the head office of Marconi's Wireless Telegraph Co., Ltd., mainly in connection with the construction and maintenance of high-power W/T stations, occupying the position of Act. Suptdng. Engr. August, 1916—March, 1919, during absence of the Suptdng. Engr. on military service.

Wibier, Albert, Lieut.-Col.—B. at Renaix, East Flanders, June 3rd, 1876. Organised and controlled the wireless service of the Belgian Army during the late war. In 1911 he installed and has since directed the wireless service of the Belgian Congo, holding the position of Director-General of that organisation. Address: 11, Rue de la Reinette, Brussels, Belgium.

Wien, Professor Max.—B. Königsberg, 1866. Made a special study of the subject of physics under Helmholtz and others, and assisted Rontgen, 1891-93. Devoted considerable attention to the study of electro-magnetic waves and their propagation, and was the originator of the quenched spark.

Wilson, Ernest, M.Inst.C.E., M.I.E.E.—Professor of Electrical Engineering, King's College, London, since 1898; Fellow of King's College and Dean of the Faculty of Engineering. Address King's College London W.C.2

Wilson, Brig.-Gen. Samuel Herbert, C.B. (1918), **C.M.G.** (1914); Officier Legion d'Honneur; French Croix de Guerre; Commandeur de la Couronne, Belgium; Belgian Croix de Guerre.—B. 1873. Entered Army, R.E., 1893 Captain 1904, Major 1913, Bt. Lt.-Col. 1916 Bt. Col. 1917. Served S. Africa, 1899-1900 (Queen's Medal with two clasps). Served great war, 1914-18; General Staff Officer, 2nd Grade, 1911-15; General Staff Officer, 1st Grade, 1915-16; Brig.-Gen. General Staff, 1916. Principal Assistant Secretary, Committee of Imperial Defence and Head of Imperial External and Defence Branch Cabinet Secretariat. Secretary Imperial Communications Committee; Wireless Telegraphy Committee; Overseas Defence Committee; Home Ports Defence Committee. Address: 22, Stanford Road, Kensington, W.8. (Tel. 5049 Western); and Heath Cottage, Puttenham, Surrey.

Wilson, Hamilton William, M.I.E.E.—B. 1878. Educ. Collegiate School, Wanganui, New Zealand. Apprenticed to Cable & Co., Marine Engineers, Wellington, N.Z. Electrical and Mechanical Engineering Courses at King's College, Strand, London, 1901 to 1904. Assistant Engineer to Metropolitan Electrical Supply Co. Ltd., London, 1904 to 1906. Chief Assistant Electrical Engineer and part time acting Electrical Engineer to East India Railway Co., Bengal, India, 1906 to 1908. Electrical Engineer to John Birch & Co. Ltd., London Wall, London, 1910 to 1911. Secretary and Director of The Wilson Apparatus Co. Ltd., Carlisle, 1911 to 1913. In private practice since 1913 as Electrical Engineer and Inventor, at Kingston Hill. Inventor of various wireless telegraph appliances and X-ray apparatus. Designed some of the earliest transformers and apparatus used for Army Aircraft Wireless, etc., before 1912. Designed and manufactured transformers, wireless telegraph condensers, and transmitting sets used in large numbers during the War by War Office, Admiralty and Royal Air Force. Joint author of various papers in "The Electrician," etc. Author of paper before Royal Society on Ruhmkorff Coils, and paper before Physical Society of London on construction of Thermo-Electric Appliances.

Yagi, Professor Hidetsugu, Professor of Electrical Engineering at the Tohoku Imperial University and Member of the Institute of Radio Engineers.—B. Osaka, January, 1886. Graduated from the Tokyo Imperial University, 1909. Lecturer and later Professor of Electrical Engineering at the Sendai Higher Technical School. Afterwards Professor of the Tohoku Imperial University. Studied in Dresden, London, and Harvard, 1913-16, engaging at the same time in several researches on radio frequency phenomena. Author of many scientific papers.

Yokoyama, Eitaro.—B. 1883. Graduated Engineering College of the Tokyo Imperial University, 1908. Radio Engineer to Ministry of Communications, Japan. Engages in radio researches at the Electro-Technical Laboratory of the Ministry. One of the inventors of T.Y.K. Oscillation Gaps of Radiotelephony. Awarded by the Ruling Emperor with the Fifth Degree of Decoration. Granted many prizes for his wireless investigations and inventions, including the Academy Prize and Medal of Japanese Imperial Academy. Proceeded to America and Europe to study, 1916. Returned to Japan, 1918, and resumed service at the same Laboratory. Promoted to the Head of the Radio Section of the Laboratory, 1920. Holds additional posts as Engineer to the Formosan Government and Lecturer of the Tokyo Higher Technical School. Private address: Kiharayama 1523, Omori, Tokyo.

Zenneck, Professor, Dr. J., Professor of Experimental Physics at the Institute of Technology, Munich.—B. April 15th, 1871, in Wurtemberg. Studied for four years in a Theological College at Tubingen. Abandoning theology, studied mathematics and natural history, particularly zoology, 1889-94. Passed the State examination in these subjects, 1894. Obtained his doctorate, 1894. Studied natural history in London and elsewhere. Subsequently devoted himself entirely to physics. Assistant in the Physical Institute in Strassburg, 1895-99. Engaged in making tests with wireless telegraphy in the North Sea, 1899-1900. Lecturer, Assistant Professor of Physics in the Technical College, Dantzic, 1905. Professor of Physics at the Technical College, Brunswick, 1906. Joined one of the largest chemical works in Germany, 1909. Professor of Physics at the Institute of Technology, Dantzig, 1911, Munich, 1913. During part of the war Technical Adviser to the Atlantic Communication Co., which then operated Sayville wireless station. Address: Technische Hochschule, Munchen, Germany.

OBITUARY.

SINCE we went to Press with our last edition, the world of wireless has had to mourn the loss of two prominent men.

* * * * * *

On May 17th, 1921, the death occurred, in New York, of **DR. EDWARD BENNETT ROSA,** Chief Physicist of the United States Bureau of Standards. Dr. Rosa, who was born in 1861, carried out many notable researches in electricity, and during the war was responsible for valuable improvements in aircraft and directional wireless used by the American forces in France.

We regret to have to record the death, resulting from a railway accident on September 19th, 1921, of **COLONEL THOMAS THOMASSEN HEFTYE,** Director-General of Norwegian Telegraphs. Colonel Heftye was born in 1860, and was educated at the University at Christiania. After a business career lasting five years, he entered the Army, being gazetted to the Corps of Royal Engineers. It was in 1905 that he became intimately connected with wireless telegraphy, on his appointment as Director of Telegraphs. Realising from the first the value of a national wireless system, Colonel Heftye strenuously advocated the establishment of the present efficient organisation in Norway.

LITERATURE
: SECTION :

(A) New Radio Books dealing with Wireless

(B) Résumé of Articles published in 1921

(C) Standard Publications on Wireless :—

(i) Books.

(ii) Periodicals.

LITERATURE OF WIRELESS TELEGRAPHY AND TELEPHONY

THE literature of radiotelegraphy and telephony increases year by year, and has now reached the stage when we consider that our readers will find it useful to have a record of the various items which have appeared during the past year, not merely in the shape of books, but also of periodical publications. The *résumé* which finds a place below covers only the more important of such items as deal directly with the subject of this volume; for works and papers on the more general subjects we must refer readers elsewhere.

(A) NEW BOOKS DEALING WITH WIRELESS.

The Wireless Experimenter's Manual, Incorporating How to Conduct a Radio Club. Elmer E. Bucher. [New York: *Wireless Press Inc.* 1920. Pp. 335. Price 12s. 6d. net.]

Report of the Chief Signal Officer of the U.S. Army to the Secretary of War, U.S.A., 1920. [Washington: *Government Printing Office.* 1920. Pp. 64.]

Report of the Director of the Air Service to the Secretary of War, U.S.A. [Washington: *Government Printing Office.* 1920. Pp. 40.]

Radio Questions and Answers. A. R. Nilson. [New York: *McGraw-Hill Book Co., Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6-8, Bouverie Street, E.C.4. 1022. Pp. 92. Price 5s. net.]

Experimental Wireless Stations. Philip E. Edelman, E.E. [London: *Henry Frowde and Messrs. Hodder & Stoughton.* Revised Edition, 1920. Pp. x+392. Price 16s. net.]

The Electrician's Handy Book: A Reference Book for the Advanced Electrician, and a Text-book for the Student. T. O'Conor Sloane, A.M., E.M., Ph.D. [London: *Henry Frowde and Messrs. Hodder & Stoughton.* Fifth edition, 1920. Pp. 823. Price £1 7s. 6d. net.]

Wireless Design and Practice: Part I., Transmitters and Receivers. Part II., Practical Circuits. M. B. Sleeper. [London: *Henry Frowde and Messrs. Hodder & Stoughton.* 1920. Pp. 246. Price 7s. 6d. net.]

Longueurs d'onde et Propagation. M. Vieillard. [Paris: *Gauthier-Villars et Cie.* 1921. Pp. xii+416. Price 55 fr.]

High-Frequency Apparatus. Thomas S. Curtis. [London: *Page & Co.* 1921. Pp. 260, with 150 diagrams. Price not stated.]

Wireless Telegraphy: With Special Reference to the Quenched Spark System. B. Leggett, A.M.I.E.E. [London: *Chapman & Hall, Ltd.* 1921. Pp. xv+485. Price 30s. net.]

Modern High-Speed Influence Machines, their Principles, Construction, and Applications to Radiography, Radiotelegraphy, Spark Photography, Electro-Culture, Electro-Therapeutics, High-Tension Gas Ignition, the Testing of Materials, etc. V. E. Johnson, M.A. [London: *E. and F. N. Spon, Ltd.* 1921. Pp. viii+278. Price 14s. net.]

Notions Elémentaires de Télégraphie sans Fil et Construction Pratique de Postes Récepteurs. (Ondes Amorties et Entretenues.) Jean Remaur. [Paris: *Librairie Générale Scientifique et Industrielle Desforges.* 1921. Pp. 116. Price 7 fr. 50.]

Continuous Wave Wireless Telegraphy. W. H. Eccles, D.Sc. [London: *The Wireless Press, Ltd.* 1921. Pp. vii+407, with 306 diagrams. Price 25s. net.]

Arithmetic of Telegraphy and Telephony. T. E. Herbert and R. G. de Wardt. [London: *Sir Isaac Pitman & Sons, Ltd.* 1921. Pp. vii+187. Price 5s. net.]

Einfuhrung in die Elektrotechnik unter Zugrundelegung der Vorlesungen. Professor Slabys. Revised by Otto Nairz. [Leipzig: *J. A. Barth.* Pp. viii+415. Price M.25·20.]

Wireless Telegraphy and Telephony: An Outline for Electrical Engineers and Others. L. B. Turner, M.A., M.I.E.E. [London: *The Cambridge University Press.* 1921. Pp. xii+195. Price 20s. net.]

A Catalogue of British Scientific and Technical Books. Prepared by a Committee of the British Science Guild. [London: *The British Science Guild.* 1921. Pp. xviii+376. Price 10s. net.]

The Signal Service in the European War of 1914-1918 (France). By R. E. Priestley, M.C., B.A. (late Major, R.E.). Published by the Secretary of the Institution of Royal Engineers, and by the Signals Association. [Chatham: *W. & J. Mackay & Co., Ltd.* 1921. Pp. xvi+359. Price not stated.]

The Admiralty Handbook of Wireless Telegraphy, 1920. [London: *H.M. Stationery Office.* 1920. Pp. viii+477. Price 7s. 6d. net.]

Het Draadloos Zendstation Voor Den Amateur (Telegrafie en Telefonie). J. Corver. ['s-Gravenhage: *N. Veenstra.* 1920. Pp. 106. Price not stated.]

Electricity at High Pressures and Frequencies. H. L. Transtrom. [Chicago: *The Joseph G. Branch Publishing Co.* Second Edition, 1921. Pp. xi+247. Price $2.50.]

The Thermionic Vacuum Tube and its Applications. H. J. van der Bijl. [New York: *McGraw-Hill Book Co., Inc.* London: *McGraw-Hill Publishing Co., Ltd.* 1921. Pp. 391. Price 30s. net.]

Die Neuere Entwicklung der Funkentelegraphie ein Siegeszug der Vakuumrohre. Dr. H. Wigge. [Cothen-Anhalt: *Verlag der Ingenieur-Zeitung.* Second edition. 1921. Pp. v+71. Price not stated.]

Principles of Radio Communication. J. H. Morecroft (Assistant Professor of Electrical Engineering, Columbia University), assisted by A. Pinto and W. A. Curry. [New York: *John Wiley & Sons, Inc.* London: *Chapman & Hall, Ltd.* 1921. Pp. x+935. Price 45s. net.]

Thermionic Tubes in Radiotelegraphy and Telephony. John Scott-Taggart, A.M.Am.I.E.E. [London: *The Wireless Press, Ltd.* 1921. Pp. xxiii+424, with 344 diagrams. Price 25s. net.]

The Alexanderson System for Radio Telegraph and Radio Telephone Transmission. Elmer E. Bucher. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.* Pp. 55. Price 10s. 6d. net.]

Les Tubes à Vide. P. Dapsence. [Paris: *G. Pericaud.* Second edition, 1921. Pp. 49. Price 2.50 fr.]

Radiotelefonia. D. Ravalico. [Turin: *S. Lattes & C.* 1920. Pp. vii+219. Price L.14.]

La T.S.F. par les Tubes à Vide. P. Louis. [Paris: *Librairie Vuibert.* 1920. Pp. 143. Price 6 fr.]

Le Livre de l'Amateur de T.S.F. J. Roussel. [Paris: *Librairie Vuibert.* 1921. Pp. vi+304. Price 15 fr.]

Appareils et Installations Télégraphiques. E. Montoriol, with a Preface by M. Blondel. [Paris: *Librairie J. B. Baillière et Fils.* 1921. Pp. 625, with 440 figures. Price 40 fr.]

De Internationale Organisation van het Radio-Electrische Verkeer. C. F. van Dissel. [Leiden: *A. W. Sitjthoff's Uitgeversmaatschappij.* Pp. 48. Price fl. 0·50.]

Fifty Years of Electricity. J. A. Fleming, M.A., D.Sc., F.R.S. [London: *The Wireless Press, Ltd.* 1921. Pp. xi+371. Price 30s. net.]

Nouveau Traité Pratique de T.S.F. P. le Graverand. [Paris: *G. Pericaud.* Eighth edition. Pp. 80. Price 2 fr.]

Wellentelegraphie. Hanns Gunther. [Stuttgart: *Franckh'sche Verlags-handlung.* Pp. 112. Price M. 6·60.]

Télégraphie et Téléphonie sans fil. C. Gutton. [Paris: *Librairie Armand Colin.* Pp. 188. Price 5 fr. Paper covers. Bound 6 fr.]

Einführung in die moderne drahtlose Telegraphie und ihre praktische Verwendung. Hugo Mosler. [Braunschweig: *Friedrich Vieweg und Sohn.* 1920. Pp. 240, with 218 figures. Price M. 24.]

La direction des avions par Télégraphie sans fil. M. Percheron. [Paris: *Librairie Ernest Leroux.* Pp. 60. Price 2 fr.]

Radiotelegraphisches Praktikum. H. Rein and K. Wirtz. [Berlin: *Julius Springer.* Second Edition, 1921. Pp. xxiii+557. Price M. 120.]

Radiotelefonia Espanola. Rufino Geay Sacasa [Madrid: *El Telegrafo espanol.* Pp. 56. Price 4 pesetas.]

Prepared Radio Measurements with Self Computing Charts. Ralph R. Batcher, E.E. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.* 1921. Pp. 132, Price 10s. 6d. net.]

La Théorie et la Pratique des Radiocommunications—II. La Propagation des Ondes Electromagnétiques à la Surface de la Terre. Léon Bouthillon. [Paris: *Librairie Delagrave.* 1921. Pp. xv+340, with 133 figures. Price 20 fr.]

Directive Wireless Telegraphy, Direction and Position Finding, etc. L. H. Walter, M.A., A.M.I.E.E. [London: *Sir Isaac Pitman & Sons, Ltd.* 1921. Pp. xii+124, with 57 diagrams and illustrations. Price 2s. 6d. net.]

The Framework of Wireless Telegraphy: A new Theory of Electric Wave Sources and Propagations with Rational Applications. R. C. Galletti di Cadillhac. [London: *Crosby, Lockwood & Son.* 1921. Pp. 48, with 6 diagrams. Price 3s. 6d. net.]

(B) RÉSUMÉ OF ARTICLES PUBLISHED DURING 1921

A complete list of all articles dealing with wireless would occupy too much space in a volume of this character. A review of radio literature is now being issued monthly in the pages of *The Radio Review*, so that a complete list of such articles as are published month by month, with abstracts of their contents, is now available. The following list, therefore, merely contains references to the most important only of the technical articles that have appeared since our last edition, or which were inadvertently omitted from the list there given These are roughly classified under separate headings, but it should be noted that in many cases articles may refer to more than one branch of the subject. This is particularly the case with articles dealing with valves, which have applications in almost every branch of radio work.

RADIO FREQUENCY MEASUREMENTS AND THEORY.

Damped Electric Oscillations. R. B. Abbott. [*Physical Review,* 17, pp. 482-492, April; pp. 510-511, April, 1921.]

Direct Reading Apparatus for the Measurement of Alternating Currents: the Amplifying Voltmeter. H. Abraham, E. Bloch and L. Bloch. [*Journal de Physique et la Radium,* 1, pp. 44-57, August, 1920.] Also. H. Abraham. [*Annales des Postes, Télégraphes et Téléphones,* 9, pp. 107-207, June, 1920.]

A Law Regarding Antenna Models. M. Abraham. [*Jahrbuch Zeitschrift für drahtlose Telegraphie,* 16, pp. 67-70, July, 1920.]

Magnetic Losses at High Frequency. E. F. W. Alexanderson. [*Electrical World*, 77, p. 163, January 15th, 1921.]

The Wave-Front Angle in Radiotelegraphy. L. W. Austin. [*Journal of the Washington Academy of Sciences*, 11, pp. 101-106, March 4th, 1921.]

Determination of the Direction of Atmospheric Disturbances or Static in Radiotelegraphy. L. W. Austin. [*Journal of the Franklin Institute*, 171, pp. 617-629, May, 1921.]

The Application of the Austin-Cohen Formula to the Solution of Some Important Problems of Radiotelegraphic Transmission. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 114-125, August, 1920.]

Triple Pendulums with Mutual Inter-action and the Analogous Electrical Circuits. E. H. Barton and Miss H. M. Browning. [*Philosophical Magazine*, 40, pp. 611-618, November, 1920.]

Three Magnetically-Coupled Circuits. E. Bellini. [*Electrician*, 85, p. 78, July 16th, 1920.]

On the Influence of Antenna Height on the Range of Wireless Stations. J. Bethenod. [*Radioélectricité*, 1, p. 285, November, 1920.]

On the Effective Capacity and Resistance of a Condenser for High Frequency Currents. F. C. Blake. [*Physical Review*, 16, pp. 540-557, December, 1920.]

On Electrostatic Transformers and Coupling Coefficients. F. C. Blake. [*Journal of the American Institute of Electrical Engineers*, 40, pp. 23-29, January, 1921.]

The Effect of Modulation Wavelength upon Received Signals. A. S. Blatterman. [*Radio Review*, 2, pp. 144-151, March; pp. 187-197, April, 1921.]

A New Method of Calculation by the Separation of Power, Applicable to Radiotelegraphy, P. Boucheron. [*Radioélectricité*, 1, pp. 73-81, July 1920.]

On the Charging of Condensers by an Alternating E.M.F. and their Discharge through a Spark Gap. An Investigation of the Conditions for the Production of a Musical Note. L. Bouthillon. [*Radioélectricité*, 1, pp. 286-291, November, 1920; pp. 448-454, February, 1921; pp. 533-546 April, 1921.]

Skin Effect on Round Wires. C. Breitfeld. [*Elektrotechnik und Machinenbau*, 38, pp. 537-543, November, 1920.]

Wireless Telegraphy in Space. W. Burstyn. [*Jahrbuch Zeitschrift für drahtlose Telegrahpie*, 16, pp. 322-337, November, 1920.]

Coupling Phenomena with Undamped Oscillations. W. Burstyn. [*Elecktrotechnische Zeitschrift*, 41, pp. 951-954, December 2nd, 1920.]

Wave Propagation over Parallel Wires: the Proximity Effect. J. R. Carson. [*Philosophical Magazine*, 41, pp. 607-633, April, 1921.]

Theory and Calculation of Variable Electrical Systems. J. R. Carson. [*Physical Review*, 17, pp. 116-134, February, 1921.]

The Composition, Ionisation and Viscosity of the Atmosphere at Great Heights. S. Chapman and E. A. Milne. [*Quarterly Journal of the Royal Meteorological Society*, 46, p. 357, 1920.]

The Theory of Linear-sinoidal Oscillations. H. G. Cordes. [*Physical Review*, 16, pp. 179-201, September, 1920.]

Current Suppression by Means of Parallel Resonance. H. G. Cordes. [*Radio Review*, 2, pp. 358-370, July, 1921.]

An Integration Method of Deriving the Alternating Current Resistance and Inductance of Conductors. H. L. Curtis. [*Bureau of Standards Scientific Paper*, No. 374, April 7th, 1920; *Bulletin of the Bureau of Standards*, 16, pp. 93-124.]

A Sensitive Valve Method for the Measurement of Capacity. J. J. Dowling. [*Proceedings of the Dublin Royal Society*, 16, pp. 175-184, December, 1920.]

The Capacitance of Flat Top Antennae. W. H. Eccles. [*Electrician*, 86, p. 72, January 14th, 1921.]

Inaugural Address to the Wireless Section of the Institution of Electrical Engineers. W. H. Eccles. [*Journal of the Institution of Electrical Engineers*, 59, pp. 77-84, December, 1920; *Radio Review*, 2, pp. 31-37, January, 1921.]

Some Thermionic Tube Circuits for Relaying and Measuring. W. H. Eccles and Miss W. A. Leyshon. [*Journal of the Institution of Electrical Engineers*, 59, pp. 433-438, April, 1921.]

The Effect of the Heaviside Layer on the Apparent Direction of Electromagnetic Waves. T. L. Eckersley. [*Radio Review*, 2, pp. 60-65, February; pp. 231-248, May, 1921.]

The Mutual Inductance of Single Turn Rectangles and Squares. A. Esau. [*Anallen der Physik*, 61, pp. 151-154, August, 1920.]

The Calculation of the Self and Mutual Inductance of Coils. A. Esau. [*Radio Review*, 1, pp. 763-768, December, 1920.]

Coil Aerials: their Inductance, Capacity and Natural Frequencies. A. Esau. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 162-190, September, 1920.]

Radiogoniometric Investigations. G. Ferrié, R. Jouaust, R. Mesny, and A. Perot. [*Comptes Rendus*, 172, pp. 44-57, January 3rd, 1921.]

A High-Frequency Resistance Standard. J. G. Frayne. [*Physical Review*, 17, pp. 415-416, March, 1921.]

The Permeability of Nickel at High Frequencies. R. Gans and R. G. Loyarte. [*Annalen der Physik*, 64, pp. 209-249, February 9th, 1921.]

Natural Frequency and Harmonics of Single Layer Coils. E. Geiss. [*Annalen der Physik*, 64, pp. 377-400, February 14th, 1921.]

The Calibration of Thermo-Junctions as A.C. Ammeters. W. Gereach. [*Physikalische Zeitschrift*, 21, pp. 550-551, October 15th, 1920.]

Capacity Effects in High-Frequency Measurements. E. Giebe and E. Alberti. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 242-251, October, 1920.]

A Method of Measuring the Specific Inductive Capacity of Air. E. W. B. Gill. [*Radio Review*, 2, pp. 450-454, September, 1921.]

On the Measurement of Changes in Resistance by a Valve Method. R. T. Beatty and A. Gilmour. [*Philosophical Magazine*, 40, pp. 291-295, September, 1920.]

The Transmission of Wireless Signals between Toulon and Tahiti. M. Guierre. [*Bulletin Société Française des Électriciens*, 10, pp. 247-268, July, 1920; *Radio Review* 2, pp. 618-635, December, 1920.]

The Standardisation of Antenna Ammeters. J. Guinchant. [*Radioélectricité*, 1, pp. 441-442, February, 1921.]

Harmonics and Normal Mode of Vibration. G. W. O. Howe. [*Radio Review*, 2, pp. 449-450, September, 1921.]

A Low Voltage Cathode Ray Oscillograph. J. B. Johnson. [*Physical Review*, 17, pp. 420-421, March, 1921.]

Distributed Capacity in Transformer and Induction Coils: The Discrepancy between Theory and Experiment. P. Joye and M. Besoson. [*Bulletin of the Schweizerische Elektrotechniker Verein*, 12, pp. 37-41, February, 1921.]

Constant High Resistances for Measurement and Loading. J. E. Lilienfeld and W. Hofmann. [*Elektrotechnische Zeitschrift*, 41, pp. 870-873, November 4th, 1920.]

The Transmission of Electric Waves around the Earth's Surface. H. M. Maconald. [*Proceedings of the Royal Society*, 98A, pp. 116-222, December 3rd, 1920; and pp. 409-411, March 3rd, 1921.]

On the Question of the Existence of Two Resonant States in Circuits containing Iron. F. Margand. [*Revue Générale de l'Électricité*, 9, pp. 635-637, May 7th, 1921.]

Alternating Current Measurements on Amplifying Valves. F. F. Martens. [*Zeitschrift für Physik*, 4, pp. 437-440, 1921.]

Polarisation Capacity and Polarisation Resistance as Dependent upon Frequency. E. Merritt. [*Physical Review*, 17, pp. 524-525, April, 1921.]

The Measurement of the Effective Height of Aerials: a Special Case. G. Pession. [*Radio Review*, 2, pp. 228-231, May, 1921.]

Capacity of Aerials. G. Pession. [*L'Elettrotecnica*, 8, pp. 10-13, January, 1921.]

On the Propagation of Electromagnetic Waves around the Earth. B. van der Pol. [*Philosophical Magazine*, 40, p. 163, July, 1920.]

On the Use of Vector Methods in the Derivation of the Formulae used in Inductance and Capacity Measurements. H. H. Poole. [*Philosophical Magazine*, 40, pp. 793-809, December, 1920.]

On Systems with Propagated Coupling. A. W. Porter and R. E. Gibbs. [*Philosophical Magazine*, 41, pp. 432-440, March, 1921.]

Q_m. **Operators and Hysteresis Harmonics.** A. Press. [*Electrician*, 86, pp. 72-73, January 14th, 1921.]

Antenna Form Factor. A. Press. [*Electrician*, 85, pp. 492-493, October 29th, 1920.]

Theory of Antenna Radiation. A. Press. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 525-540, December, 1920.]

The Significance of Maxwell's Theory. A. Press. [*Electrician*, 85, pp. 177-178, August 13th, 1920.]

The Wavelength Relation for a Generalised Bessel's Antenna. A. Press. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 441-447, October, 1920.]

The Damping in Two Inductively Coupled Oscillatory Circuits with Tight Coupling. W. Rogowski. [*Archiv für Elektrotechnik*, 9, pp. 427-438, March, 1921.]

Improvements in Cathode Ray Oscillographs. W. Rogowski. [*Archiv für Elektrotechnik*, 9, pp. 115-120, July 8th, 1920.]

Some Electrical Guides for Wavemeter Design. O. C. Roos. [*Wireless Age*, 7, pp. 17-22, September, 1920.]

Universal, Honeycomb and Lattice Coils in General. O. C. Roos. [*Wireless Age*, 7, pp. 22-24, July; pp. 23-26, August; pp. 12-19, October; pp. 14-16, November; pp. 16-17, December, 1920.]

A Use for the Valve in Wireless Measurements. H. J. Round. [*Radio Review*, 2, pp. 303-307, June, 1921.]

The Capacity Coefficients of Spherical Conductors. A. Russell. [*Proceedings of the Royal Society*, 97A, pp. 160-172, April 15th, 1920.]

The Limit of Sensitiveness of the String Galvanometer. J. K. A. W. Salomonson. [*Proceedings of the Koninklijke Akademie van Wetenschappen, of Amsterdam*, 23, pp. 613-615, No. 4, 1921.]

On the Propagation of Undamped Electric Oscillations in Water and on the Dielectric Constant of Water. M. Sauzin. [*Comptes Rendus*, 171, pp. 164-167, June 19th, 1920.]

Electromagnetic Waves on Dielectric Wires. O. Schrieven. [*Annalen der Physik*, 63, pp. 645-673, December 1st, 1920.]

Two Laboratory Functions of the Triode Valve. J. Scott-Taggart. [*Electrician*, 86, p. 124, January 28th, 1921.]

On the Discontinuous Resonance Curves of Triode Oscillators. W. Seitz. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 460-469, June, 1920.]

The Functions of the Earth in the Transmission of Electricity. C. E. Snell. [*Electrical Review*, 87, pp. 421-423, October 1st, 1920.]

The Transmission of Waves in Radiotelegraphy. A Sommerfeld. [*Annalen der Physik*, 62, pp. 95-96, May 20th, 1920.] Also H. Weyl. [*Loc. cit.*, 62, pp. 482-484, July 8th, 1920.]

Electrical Measurements at Ultra-Radio Frequencies. G. C. Southworth. [*Radio Review*, 2, pp. 25-31, January, 1921.]

On Some Optical Effects including Refraction and Rotation of the Plane of Polarisation due to the Scattering of Light by Electrons. J. J. Thomson. [*Philosophical Magazine*, 40, pp. 713-734, December, 1920.]

The Use of a Valve Oscillator for the Measurement of Inductance and Capacity at the General Post Office, London. A. Tobler. [*Journal Télégraphique*, 44, pp. 117-123, August 25th, 1920.]

Electric Oscillations along Straight Wires and Solenoids. J. S. Townsend. [*Journal of the Institution of Electrical Engineers*, 59, pp. 771-779, July, 1921.]

The Electron Tube as a Measuring Instrument. Trautwein. [*Telegraphen- und Fernsprech-Technik*, 9, pp. 101-104, September; pp. 119-123, October, 1920.]

Optimum Wavelength and Atmospherics. L. B. Turner. [*Radio Review*, 2, pp. 524-534, October, 1921.]

Measurements of Radiation of Radiotelegraphic Aerials. G. Vallauri. [*Radio Review*, 2, pp. 77-85, February; pp. 138-143, March; pp. 179-187, April, 1921.]

The Penetration of an Electromagnetic Wave into a Coil having Self-Capacity. K. W. Wagner. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, p. 484, June, 1920.]

The Ultra-Micrometer: An Application of the Thermionic Valve to the Measurement of very small Distances. R. Whiddington. [*Philosophical Magazine*, 40, pp. 634-639, November, 1920.]

Capacitive Coupling in Radio Circuits. L. E. Whitmore. [*Physical Review*, 15, pp. 559-562, June, 1920.]

Physical Features and Wireless Transmission. J. Williamson. [*Wireless World*, 8, pp. 389-395, August 21st, 1920.]

Oscillating Circuits with Triode Generators as Acoustic Frequency Standards. [*Zeitschrift für Instrumentenkunde*, 40, pp. 119-120, June, 1920.]

TRANSMITTING APPARATUS.

On the Function of the Variable Anode Tap Connection in Triode Generators. E. V. Appleton. [*Radio Review* 2, pp. 419-424, August, 1921.]

A Comparison of High Frequency Alternators, Arcs and Valve Transmitters. G. von Arco. [*Telefunken Zeitung*, 4, pp. 5-8, March, 1921.]

Description of a Uni-Wave Signalling System for Arc Transmitters. W. A. Eaton. [*Electric Journal*, 18, pp. 114-115, April, 1921.]

Duplex Operation by Two Arcs. L. F. Fuller. [*Wireless Age*, 8, p. 20, January, 1921.]

Triode Oscillation Generators with Coupled Oscillatory Circuits. F. Harms. [*Radio Review*, 2, pp. 313-322, June, 1921.]

Heising's Modulator Method. R. A. Heising. [*Wireless Age*, 8, pp. 20-21, November, 1920.]

Researches on Frequency Transformers. T. Kujirai. [*Journal of the College of Engineering, Tokyo*, 10, pp. 37-143, March 30th, 1920.]

The Production of High-Frequency Currents by Dynamo-Electric Machinery. M. Latour. [*Annales des Postes, Télégraphes et Téléphones*, 10, pp. 32-59, March, 1921.]

On a Static Frequency Multiplier. P. Mauv and V. Bontron. [*Revue Générale de l'Électricité*, 9, pp. 523-527, April 16th, 1921.]

The Use of the Impulsion Wave Method—Frequency Doublers. T. Minnohara. [*Revue Générale de l'Électricité*, 8, pp. 859-862, December 18th, 1920.]

Some Improvements in the Poulsen Arc. P. O. Pedersen. [*Electrician*, 86, pp. 684-686, June 3rd; pp. 714-716, June 10th, 1921.]

On the Poulsen Arc in Coupled Circuits. P. O. Pedersen. [*Proceedings of the Institute of Radio Engineers*, 9, pp. 228-242, June, 1921.]

Some Improvements in the Poulsen Arc. P. O. Pederson. [*Proceedings of the Institute of Radio Engineers*, 9, pp. 434-441, October, 1921.]

On Radio Stations with Synchronous Rotary Spark Gaps. F. Perrin. [*Radio-électricité*, 1, pp. 503-506, March, 1921.]

Static Frequency Doublers. J. F. Peters. [*Electric Journal*, 28, pp. 122-123, April, 1921.]

Calorimetric Determination of Efficiency of Triode Generators. G. Preuner and L. Pungs. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 469-479, June, 1920.]

The Load on the Modulation Tube in Radio Telephony Sets. E. S. Purington. [*Physical Review*, 15, pp. 556-557, June, 1920.]

High Voltage D.C. Machines for Supplying Spark Stations. W. Rogowski. [*Archiv für Elektrotechnik*, 9, pp. 191-226, September, 1920.]

The Status of the Static Frequency Doubler in Radio Engineering Practice. F. C. Ryan. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 509-524, December, 1920.]

Advantages and Disadvantages of Various Systems of Transforming High Tension Alternating Current. F. Serrant. [*Houille Blanche*, 19, pp. 101-106, May and June, 1920.]

The Efficiency of Various Transmitting Valve Connections. W. Seitz. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 457-460, June, 1920.]

The Use of a Spacing Wave in Continuous Wave Wireless Telegraphy. E. H. Shaughnessy. [*Post Office Electrical Engineers' Journal*, 14, pp. 30-32, April, 1921.]

The Poulsen Arc. E. W. Stone. [*Proceedings of the U.S. Naval Institute*, 46, pp. 1049-1073, July, 1920.]

The Breakdown and Protection of High Voltage D.C. Machines Supplying Spark Transmitters. K. W. Wagner. [*Elektrotechnische Zeitschrift* 41, pp. 581-584, July 29th; pp. 605-606, August 5th, 1920; also *Radio Review*, 2, pp. 22-25, January, 1921.]

A Contribution to the Theory of Magnetic Frequency Changers. J. Zenneck. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 468-491, December, 1920.]

RADIOTELEPHONY.

Wireless Telephony with the Poulsen Generator. Lorenz Company. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, pp. 373-375, May, 1921.]

Radio Telephone Circuits and Modulation. W. A. Macdonald. [*Radio Review*, 2, pp. 409-419, August, 1921.]

Radiotelephony with Triode Transmitters. W. Schaffer. [*Tijdschrift van het Nederlandsch Radiogenootschap*, 1, pp. 35-67, March, 1921.]

The Vacuum Tube in Radiotelephony. J. Scott-Taggart. [*Electrician*, 85, pp. 301-303, September 10th, 1920.]

An American Duplex Radiotelephone Set. M. B. Sleeper. [*Radio Review*, 2, pp. 751-753, December, 1920.]

Wireless Telephony. H. Zickendraht. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, pp. 369-372, May, 1921.]

RECEIVING APPARATUS.

Abstractive and Selective Properties of Radio Antennae Circuits. E. Bennett. [*Journal of the American Institute of Electrical Engineers*, 39, pp. 995-1,004, November; pp. 1,052-1,062, December, 1920.]

A New Method for the Reception of Radio Signals, Eliminating Static and Interference. I. Cohen and J. O. Mauborgne. [*Journal of the Franklin Institute*, 191, pp. 423-424, March, 1921.]

Carborundum and its Rectification Effect. H. M. Dowsett. [*Radio Review*, 2, pp. 582-594, November; pp. 642-659, December, 1921.]

Rectification by Galena. C. Florisson. [*Comptes Rendus*, 171, pp. 106-108, July 12th, 1920.]

On a Method of Reducing the Effects of Atmospherics. W. Gerlach. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 337-344, November, 1920.]

The Use of Coils Instead of Antennae as Wireless Receivers. H. Hoffmann. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 31-66, July, 1920.]

The Heterodyne Method of Wireless Reception, its Advantages and its Future. M. Latour. [*Radio Review*, 2, pp. 15-21, January, 1921.]

Contact E.M.F. and Rectification. H. Rohmann. [*Physikalische Zeitschrift*, 21, pp. 699-703, December 1st, 1920.]

A New Wireless Call Arrangement. E. H. Shaughnessy. [*Electrical Review*, 87, pp. 68-69, July 16th, 1920.]

Wireless Telegraphic Printing on the Creed Automatic System. A. A. Campbell Swinton. [*Wireless World*, 8, pp. 641-648, December, 1920.]

Reception of Wireless Waves on a Shielded Frame Aerial. A. A. Campbell Swinton. [*Radio Review*, 2, pp. 545-547, October, 1921.]

RADIO INSTALLATIONS (INCLUDING DIRECTION FINDING).

The Alexanderson High Frequency Machine and the High-power Station at New Brunswick. F. Linke. [*Zeitschrift des Vereines deutscher Ingenieure*, 65, pp. 467-469, July 30th, 1921.]

Commercial Progress in Aircraft Wireless. R. H. Barfield. [*Radio Review*, 2, pp. 4-14, January, 1921.]

The Errors of Direction Finders. E. Bellini. [*Electrician*, 86, pp. 220-222, February 18th, 1921.].

Duplex Radiophone Receiver on U.S.S. "George Washington." H. H. Beverage. [*General Electric Review*, 23, pp. 807-812, October, 1920.]

The Proposed Radio Station at Sainte-Assize, near Melun. A. Bidault des Chaumes. [*Génie Civil*, 78, pp. 73-78, January 22nd, 1921.]

The Role of the Paris Radio Central. [*Radioélectricité*, 1, pp. 378-392, January, 1921.]

The Large French Radio Centre. [*Radioélectricté*, 1, pp. 393-403, January, 1921.]

The Inauguration of the London-Paris Radio Service. [*Radioélectricité*, 1, pp. 404-408, January, 1921.]

The Inauguration of the Paris Radio Central. [*Radioélectricité*, 1, pp. 369-377, January, 1921.]

The Paris Radio Central—June, 1921. [*Radioélectricité*, 2, pp. 14-24, July, 1921.]

Wireless and the Mercantile Marine. de Bouillane. [*Radioélectricité*, 1, pp. 280-284, November; pp. 325-335, December, 1920; pp. 443-447, February, 1921.]

The Most Powerful Station in the World. L. V. Bournat. [*Technique Moderne*, 13, pp. 49-54, February, 1921.]

The Application of Radio to Navigation Problems. W. H. G. Bullard. [*Journal of the Franklin Institute*, 191, pp. 725-766, June, 1921.]

The Application of Radio to Navigation Problems. W. H. G. Bullard. [*Journal of the Franklin Institute*, 190, pp. 903-904, December, 1920.]

Wireless Telegraphy for Position Finding in Aeroplanes. M. Dieckmann. [*Luftfahrt*, 26, pp. 57-59, April 1st, 1920.]

The Guiding of Ships by Wireless. E. Devaux. [*L'Électricité*, 2, pp. 1-2, September 15th, 1920.]

New York's Radio Pilot Cable. G. Gaulois. [*Scientific American*, 123, pp. 195 and 210, August 28th, 1920.]

Directional Measurements with the R.A.F. System. J. Hollingworth. [*Radio Review*, 2, pp. 282-301, June, 1921.]

The Lafayette Radio Station. S. C. Hooper. [*Electric Journal*, 28, pp. 112-113, April, 1921.]

The Lafayette Radio Station. [*Radio Review*, 2, pp. 85-93, February, 1921.]

The Prospective Utilisation of Vessel-to-Shore Radio Compass Bearings in Aerial and Transoceanic Navigation. G. W. Littleshales. [*Journal of the American Society of Naval Engineers*, 32, pp. 38-44, February, 1920.]

Wireless in the Mercantile Marine. H. MacCallum. [*Electrician*, 85, pp. 263-266, September 3rd, 1920.]

The High-Power Station of Deutsch-Altenburg. J. Mayer and L. Hogelsberger. [*Electrotechnik und Machinenbau*, 39, pp. 2-9, January 2nd, 1921.]

The Lafayette (Bordeaux) Station—Construction of Foundations and Calculation of Stresses in Towers. H. de la Noë. [*Génie Civil*, 79, pp. 32-35, July 9th, ; pp. 53-57, July 16th, 1921.]

Radiophone Transmitter on the U.S.S. "George Washington." J. A. Payne. [*General Electric Review*, 23, pp. 804-806, October, 1920.]

Critique of Capt. Robinson's Article "A Method of Direction Finding." C. E. Prince. [*Radio Review*, 2, pp. 695-700, November, 1920.]

Directive Wireless Telegraphy in the German Navy. L. Pungs. [*Elektrotechnische Zeitschrift*, 41, p. 922, November 18th, 1920.]

The Building of Large Radio Stations. E. Reinhard. [*Telefunken Zeitung* 4, pp. 8-14, March, 1921.]

Some Recent Designs for Ship Radio Installations. H. R. Rivers-Moore. [*Radio Review*, 2, pp. 172-179, April, 1921.]

Nauen and Togoland: A Tragedy of Radiotelegraphic Development. R. Roscher. [*Radio Review*, 2, pp. 68-75, February; pp. 256-261, May, 1921.]

Official Opening of the New Nauen Station. [*Elektrotechnische Zeitschrift*, 41, p. 819, October 14th, 1920.]

The Influence of Atmospheric Conditions on Radio Direction Finding. M. Rothe. [*Comptes Rendus*, 172, pp. 1,345-1,347, May 30th, 1921.]

Clifden. H. J. Round. [*Radio Review*, 2, pp. 459-463, September, 1921.]

Multiplex Radiotelegraphy and Telephony. F. M. Ryan, J. R. Tolmie, and R. O. Bach. [*Proceedings of the Institute of Radio Engineers*, 8, pp. 451-467, December, 1920.]

Imperial Wireless Station at Leafield, Oxfordshire. E. H. Shaughnessy. [*Post Office Electrical Engineers Journal*, 14, pp. 79-89, July, 1921.]

The Opening of the Leafield Wireless Station. [*Radio Review*, 2, pp. 509-523, October, 1921.]

The Wireless Stations of the British Commercial Airways. D. Sinclair. [*Wireless World*, 8, pp. 798-810, February 19th; p. 830, March 5th, 1921.]

The Windhuk Radio Station during the War. W. Thiess. [*Telefunken Zeitung*, 4, No. 21, pp. 43-47, July, 1921.]

Nauen. H. Thurn. [*Archiv für Post und Telegraphie*, 7, pp. 253-279, July, 1921.]

The Poulsen Arc Equipment at Königswusterhausen. H. Thurn. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, pp. 194-217, March, 1921.]

The Telefunken Valve Transmitter at Königswusterhausen. Dr. Verch. [*Radio Nieuws*, 4, pp. 179-182, June, 1921.]

The Radio Stations of the French Radio Telegraph Administration. M. Verdier. [*Annales des Postes, Télégraphes et Téléphones*, 10, pp. 303-315, June, 1921.]

Wireless Telegraphy at Ushant. [*Radioélectricité*, 1, pp. 425-431, February, 1921.]

The High Power Radio Station at Nauen, near Berlin. G. Viard. [*Génie Civil*, 78, pp. 405-409, May 14th, 1921.]

The Heart-Shaped Polar Diagram and its Behaviour under Night Variations. G. M. Wright and S. B. Smith. [*Radio Review*, 2, pp. 394-403, August, 1921.]

Some Modern Improvements in Radio Installations for Ships. [*Electrician*, 86, pp. 49-51, January 7th, 1921.]

Wireless Telegraphy in the German Colonies. [*Telefunken Zeitung*, 4, No. 21, pp. 48-57, July, 1920.]

German Wireless Network. [*Telegraphen und Fernsprech-Technik*, 9, p. 149, December, 1920.]
Large German Wireless Station. [*Elektrotechnische Zeitschrift*, 41, p. 677, August 26th, 1920.]
Christiania Wireless Station. [*Telefunken Zeitung*, 4, No. 21, pp. 27-37, July, 1920.]
The Easthampton Radio Station. [*Radio Review*, 2, pp. 66-68, February, 1921.]
Radiotelegraphy in the Dutch East Indies. [*Radio Review*, 2, pp. 574-582, November, 1921.]
The Wireless Service for Press Messages from Geneva. [*Radio Review*, 2, pp. 535-537, October, 1921.]
New York Radio Central Station. [*Wireless Age*, 7, pp. 10-12, August, 1920.]

VALVES AND VALVE APPARATUS (INCLUDING AMPLIFIERS).

On the Form of Free Triode Vibrations. E. V. Appleton and B. van der Pol. [*Philosophical Magazine*, 42, pp. 201-220, August, 1921.]
A Method of Demonstrating the Retroactive Property of a Triode Oscillator. E. V. Appleton. [*Proceedings of the Physical Society of London*, 33, pp. 100-103, February 13th, 1921.]
Phenomena in Oxide-Coated Filament Electron Tubes. H. D. Arnold. [*Radio Review*, 1, pp. 745-750, December, 1920.]
Secondary Electron Emission from Copper Surfaces. I. G. Barber. [*Physica Review*, 17, pp. 322-338, March, 1921.]
Note on a Four-Electrode Thermionic Vacuum Tube. H. J. van der Bijl. [*Radio Review*, 2, pp. 571-573, November, 1921.]
The Calculation of Detecting and Amplifying Properties of an Electron Tube from its Static Characteristics. G. Breit. [*Physical Review*, 16, pp. 387-407, November, 1920.]
The Maintenance of a Vibrating System by means of a Triode Valve. S. Butterworth. [*Proceedings of the Physical Society of London*, 32, pp. 345-360, August 15th, 1920.]
The Equivalent Circuit of the Vacuum Tube Modulator. J. R. Carson. [*Proceedings of the Institute of Radio Engineers*, 9, pp. 243-249, June 1921.]
Photoelectric Effect in Oxide-coated Audion Bulb. T. W. Case. [*Electrical World*, 77, p. 894, April 16th; p. 1,175, May 21st, 1921.]
The Design of Intervalve Transformers. J. K. Catterson-Smith. [*Electrician*, 85, pp. 388-390, October 1st; pp. 414-416, October 8th, 1920.]
The Emission of Electrons from Oxide-Coated Filaments. C. Davisson and H. A. Pidgeon. [*Physical Review*, 15, pp. 553-555, June, 1920.]
Stability Conditions in Vacuum Tube Circuits. R. D. Duncan. [*Physical Review*, 17, pp. 302-314, March, 1921.]
The Production and Measurement of High Vacua. S. Dushman. [*General Electric Review*, 23, pp. 493-502, June; pp. 605-614, July; pp. 672-683, August; pp. 731-740, September; pp. 847-855, October, 1920; also 24, pp. 58-68, January, 1921; pp. 244-252, March; pp. 436-443, May, 1921.]
A Note on the Theory of the Thermionic Tube. J. A. Fleming. [*Radio Review*, 2, pp. 133-137, March, 1921.]
A Four-Electrode Thermionic Detector for Damped or Undamped Electric Oscillations of High or Low Frequency. J. A. Fleming. [*Radio Review*, 2, pp. 38-40, January, 1921.]
The Audion: its Action and some Recent Applications. L. de Forest. [*Journal of the Franklin Institute*, 190, pp. 1-38, July, 1920.]
An Oscillating Current Generator. L. de Forest. [*Wireless Age*, 7, pp. 17-18, June, 1920.]
The Dynamic Characteristics of Three-Electrode Vacuum Tubes. J. G. Frayne. [*Physical Review*, 17, pp. 391-403, March, 1921.]

The Thermionic Current between Parallel Plane Electrodes: Velocities of Emission Distributed according to Maxwell's Law. T. C. Fry. [*Physical Review*, 17, pp. 441-452, April, 1921.]

The Disappearance of Gas in the Electric Discharge—III. Research Staff of the General Electric Company (London). [*Philosophical Magazine*, 42, pp. 227-246, August, 1921.]

The Disappearance of Gas in the Electric Discharge. Research Staff of the General Electric Company (London). [*Philosophical Magazine*, 40, pp. 585-611, November, 1920.]

The Production and Control of Radio Frequency Oscillations. A. N. Goldsmith. [*Wireless Age*, 8, pp. 19-20, December, 1920.]

The Ionisation Potential of Helium. B. S. Gossling and J. W. Ryde. [*Radio Review*, 2, pp. 75-77, February, 1921.]

On Three-Electrode Valves and Recent Progress in Wireless Telephony. M. Gutton. [*Annales des Postes, Télégraphes et Téléphones*, 9, pp. 208-228, June, 1920.]

Theory of Coupled Oscillatory Circuits with Triode Generators. F. Harms. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 15, pp. 442-457, June, 1920.]

Vacuum Tube Amplifiers in Parallel. R. V. L. Hartley. [*Proceedings of the Institute of Radio Engineers*, 9, pp. 250-254, June, 1921.]

Valve Oscillators for Radio Transmitters. L. A. Hazeltine. [*Proceedings of the Radio Club of America*, 1, pp. 2-10, October, 1920.]

Theory of the Triode Oscillator with Intermediate Circuit. P. Heegner. [*Archiv für Electrotechnik*, 9, pp. 127-152, August, 1920.]

New Experiments with the Dynatron. F. Holborn. [*Telegraphen- und Fernsprech-Technik*, 10, pp. 1-10, January-February; pp. 17-22, March, 1921.]

The Electrical Conduction in Gases. G. Holst and E. Oosterhuis. [*Physica*, 1, pp. 78-87, June, 1921.]

Double-Grid Valves. G. W. O. Howe. [*Radio Review*, 2, pp. 337-340, July, 1921.]

The Action of the Grid Leak in the Audion Detector. G. W. O. Howe. [*Radio Review*, 2, pp. 570-571, November, 1921.]

The Detecting Efficiency of the Single Electron Tube. E. O. Hulburt and G. Breit. [*Physical Review*, 16, pp. 408-419, November, 1920.]

The Effect of a Uniform Magnetic Field on the Motion of Electrons between Coaxial Cylinders. A. W. Hull. [*Physical Review*, 18, pp. 31-57, July, 1921.]

Operation of an Electron Tube as an Amplifying Receiver. L. M. Hull. [*Physical Review*, 15, pp. 557-559, June, 1920.]

The Theory of the Vacuum Discharge. G. Jaffe. [*Annalen der Physik*, 64, pp. 733-744, April 29th, 1921.]

The Theory of High Vacuum Discharges. G. Jaffe. [*Annalen der Physik*, 63, pp. 145-174, September 28th, 1920.]

Naval Radio Tube Transmitters. T. Johnson. [*Proceedings of the Institute of Radio Engineers*, 9, pp. 381-433, October, 1921.]

Fundamental Phenomena in Electron Tubes having Tungsten Cathodes. I. Langmuir. [*General Electric Review*, 23, pp. 503-513, June; pp. 589-596, July, 1920.]

The Four Functional Parameters of the Triode as Extended to the "Magnetron." M. Latour. [*Radio Review*, 2, pp. 613-615, November, 1921.]

Equilibrium Conditions for Electron Emission from Glowing Bodies. M. v. Laue. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 199-218, September, 1920.]

The Production of Alternating Current by Means of Two Triodes. G. Leithauser and K. Heegner. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, pp. 21-39, January, 1921.]

Calculation of the Amplification Constant of the Weagant Thermionic Vacuum Tube. **A. Marcus. [*Physical Review*, 17, pp. 1-6, January, 1921.]**

Photoelectric Phenomenon in Coated Filament Audion Bulbs. E. Merritt. [*Physical Review*, 17, pp. 525-526, April, 1921.]

The Application of Thermionic Devices to the Control of Electrical Machinery. F. W. Meyer. [*Elektrotechnische Zeitschrift*, 42, pp. 689-693, June 30th; pp. 725-728, July 7th, 1921.]

The Design and Construction of Audio Frequency Transformers. C. M. Minnis. [*Wireless Age*, 8, pp. 26-27, February, 1921.]

Modern Methods of Valve Manufacture. [*Radio Review*, 2, pp. 537-544, October, 1921.]

The Ionisation and Resonant Potentials of Nitrogen, Oxygen and Hydrogen. F. L. Mohler and P. D. Foote. [*Physical Review*, 15, pp. 555-556, June, 1920.]

The Theory of the Phase Reversal in Coupled Oscillatory Valve Circuits. H. G. Moller. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 402-431, December, 1920.]

The Grid Current in Amplifier Valves. K. Muhlbrett. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, pp. 288-294, April, 1921.]

Absorption of Gases in the Electric Discharge Tube. F. H. Newman. [*Proceedings of the Physical Society of London*, 33, pp. 73-82, February 15th, 1921.]

The Quickness of Response of Current to Voltage in a Thermionic Tube. D. Owen and R. M. Archer. [*Proceedings of the Physical Society of London*, 33, pp. 104-115, February 15th, 1921.]

Theory of the Motion of Electrons between Co-axial Cylinders taking into Account the Variation of Mass with Velocity. L. Page. [*Physical Review*, 18, pp. 58-61, July, 1921.]

An Analytical Method for Comparing the Rectifying Properties of Three-electrode Valves. L. S. Palmer. [*Radio Review*, 2, pp. 465-478, September, 1921.]

On a Kink in the Characteristic of a Soft Three-Electrode Valve. B. Hodgson and L. S. Palmer. [*Radio Review*, 2, pp. 340-354, July, 1921.]

The Effect of Impurities on the Ionisation Potentials Measured in Thermionic Valves. L. S. Palmer. [*Radio Review*, 2, pp. 113-125, March, 1921.]

The Measurement of the Efficiency of Amplifiers. M. Pirani. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 16, pp. 2-30, July, 1920.]

Distortion in Thermionic Tube Circuits. L. C. Pocock. [*Electrician*, 86, pp. 246-247, February 26th, 1921.]

The Thermionic Tube—A Return to Simplicity. L. C. Pocock. [*Electrician*, 87, pp. 232-234, August 19th, 1921.]

Some Physical Applications of the Triode. B. van der Pol. [*Physica*, 1, pp. 97-100, July, 1921.]

Calculation of Voltage Ratio of Triode with Double Grid. M. A. Schirmann. [*Annalen der Physik*, 62, pp. 97-106, May 28th, 1920.]

Back-coupling in Double Grid Valves, with Anode Protective Grids. W., Schottky. [*Jahrbuch Zeitschrift für drahtlose Telegraphie*, 17, p. 51, January, 1921.]

The Use of Vacuum Tubes for Wireless Transmission and Reception of Continuous Waves. J. Scott-Taggart. [*Journal of the Institution of Electrical Engineers*, 58, pp. 893-897, September, 1920.]

A Double Anode Vacuum Tube, A.C. Rectifier and Wireless Transmitter. J. Scott-Taggart. [*Electrical Review*, 87, p. 298, September 3rd, 1920.]

Some New Circuits for Radiotelegraphy employing a Double Grid Vacuum Tube. J. Scott-Taggart. [*Electrician*, 86, pp. 87-98, January 21st, 1921.]

The Production of Continuous Oscillations in Circuits which contain Capacities of High Value. J. Scott-Taggart. [*Electrical Review*, 88, pp. 7-8, January 7th, 1921.]

Two New Negative Resistance Devices for Use in Wireless Telegraphy. J. Scott-Taggart. [*Radio Review*, 2, pp. 598-602, November, 1921.]

Some Applications of Thermionic Valve Rectifiers. R. L. Smith-Rose. [*Beama Journal*, 7, pp. 567-571, June; and 8, pp. 20-24, July, 1920.]

On the Relative Ionisation Potentials of Gases as observed in Thermionic Valves. G. Stead and B. S. Gossling. [*Philosophical Magazine*, 40, pp. 413-425, October, 1920.]

Effect of Electron Emission on the Temperature of the Filament and Anode of a Thermionic Valve. G. Stead. [*Journal of the Institution of Electrical Engineers*, 59, pp. 427-432, April, 1921.]

On the Design of Soft Thermionic Valves. G. Stead. [*Philosophical Magazine* 41, pp. 470-482, March, 1921.]

Behaviour of a Three-Electrode Vacuum Tube as an Oscillation Generator. E. Takagishi. [*Electrician*, 86, pp. 346-348, March 25th; pp. 374-375, April 1st, 1921.]

Experiments on Electron Emission from Hot Bodies. S. L. Ting. [*Proceedings of the Royal Society*, 98A, pp. 374-391, February 2nd, 1921.]

The Thermionic Valve as a Measuring Instrument. F. Trautwein. [*Telegraphen- und Fernsprech-Technik*, 10, pp. 69-74, June, 1921.]

Acoustic Tongue Pipes and Triode Oscillations. H. Vogel and M. Wien. [*Annalen der Physik*, 62, pp. 649-665, August 4th, 1920.]

Double-Grid Valves. A. H. de Voogt. [*Radio Nieuws*, 4, pp. 99-104, April, 1921.]

Improved Oscillator. F. K. Vreeland. [*Wireless Age*, 7, p. 26, September, 1920.]

Wireless Valve Circuits as Applied to the Measurement of Physical Quantities. R. Whiddington. [*Wireless World*, 8, pp. 739-745, January 22nd, 1921.]

Some Practical Operating Features of Tungsten Filament Electron Tubes. W. C. White. [*General Electric Review*, 23, pp. 840-846, October, 1920.]

Electron Power Tubes and some of their Applications. W. C. White. [*General Electric Review*, 23, pp. 514-526, June, 1920.]

Some Operating Characteristics of Electron Tubes. W. C. White. [*Journal of the Franklin Institute*, 191, pp. 473-492, April, 1921.]

WIRED WIRELESS.

Guided Wave Telephony. C. A. Culver. [*Journal of the Franklin Institute*, 151, pp. 301-328, March, 1921.]

Recent Attainments in Wired Wireless. R. D. Duncan. [*Journal of the Franklin Institute*, 191, pp. 23-56, January, 1921.]

High Frequency Multiplex Telephony and Telegraphy along Wires. (Part II). H. Fassbender and E. Habann. [*Jahrbuch Zeitschrift für drahtlose Telegraphie* 15, pp. 407-423, May, 1920.]

High Frequency Telephony over the Wires of a Power Distributing System. E. Fischer. [*Elektrotechnische Zeitschrift*, 41, p. 1,021, December 16th, 1920.]

Multiplex Telephony with High Frequency Currents. Bélà Gáti and K. W. Wagner. [*Elektrotechnische Zeitschrift*, 41, pp. 518-519, June 30th, 1920.]

High Frequency Telephony in High Voltage Overhead Power Distributing Systems. Gewecke. [*Elektrotechnische Zeitschrift*, 41, pp. 670-672, August 26th, 1920.]

Multiplex Telephony and Telegraphy using High Frequency Currents (Wired Wireless). K. W. Wagner. [*Radio Review*, 2, pp. 715-716, November 1920.]

Multiplex Telegraphy and Telephony with High Frequency Currents along Wires. [*Schweizerische Bauzeitung*, 76, pp. 239-242, November 13th, 1920.]

Multiple Telegraphy and Telephony with High Frequency Currents. [*Annales des Postes, Télégraphes et Téléphones*, 9, pp. 155-174, March, 1920.]

High Frequency Wire Telegraphy and Telephony. [*Telefunken Zeitung*, 4, No. 21, pp. 67-69, July, 1920.]

The First Wireless Telephone Exchange. [*Telegraph and Telephone Age*, 38, p. 425, August 1st, 1920.]

MISCELLANEOUS ARTICLES.

Eclipse of the Sun, April 8th, 1921. Effects Produced at Wireless Stations. F. Addey. [*Radio Review*, 2, pp. 226-227, May, 1921.]

Notation for Electron Tube Circuits. J. H. Dellinger. [*Radio Review*, 2, pp. 454-459, September, 1921.]

Wireless Telegraphy: Its Application and Value to the Marine Service. J. H. C. Harrold. [*Nautical Magazine*, 105, pp. 309-311, April, 1921.]

Sketch of Present Radio Situation: Influence on Tactics and Strategy. S. C. Hooper. [*Proceedings of the U.S. Naval Institute*, 46, pp. 1,209-1,218, August, 1920.]

Wireless and Meteorology. P. Schereschewsky. [*La Nature*, 49(1), pp. 12-16, January 1st, 1921.]

Telephone Receiver and Ear Sensibility. M. Wien. [*Annalen der Physik*, 62, pp. 739-762, August 20th, 1920.]

(C) STANDARD PUBLICATIONS ON WIRELESS, and Subjects intimately connected with Wireless Research and Development.

(1) BOOKS.

NOTE.—*All Books marked with an asterisk (*) are notified by the Publishers as temporarily out of print. Copies of all other Books and Periodicals may be obtained from the Mail Order Department,* THE WIRELESS PRESS, LTD., 12-13, Henrietta Street, London, W.C.2.

In cases where the names of two publishers in different countries are quoted against any particular book, the one placed first indicates the country in which the book was first published.

BELGIUM.

***Aperçu sur la Télégraphie sans Fils en Belgique.** Paul Dubois. [Liège: *Imprimerie La Meuse*. Pp. 120.]

***A Propos de Télégraphie sans Fils** (La Loi du 8 Juillet 1908, et les Signaux FL). M. L. Vandevyver. [Ghent: *H. Rousseeuw*. 1912. Pp. 20. Price 2 fr.]

***De l'Emploi des Appareils de Télégraphie sans Fil pour l'Observation des Courants Atmosphériques dans les Regions Polaires.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1907. Pp. 16. Price 0.75 fr.]

***La Captation ou la Reception des ondes Hertziennes.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1913. Pp. 13. Price 1 fr.]

***La Télégraphie sans Fil à Travers les Ages.** M. Pierard. [*Brussels University*.]

La Télégraphie sans Fil au Congo Belge. R. B. Goldschmidt and R. Braillard. [Brussels: *M. Hayez*. Pp. 120.]

***Secret de la Correspondance et Monopole radiotélégraphiques.** M. L. Vandevyver. [Ghent: *H. Rousseeuw*. 1913. Pp. 26. Price 2 fr.]

***Télégraphie sans Fil.** L. van Aerschodt. [Brussels: *Veuve Ferd. Larcier*. 1913. Pp. 27. Price 0.50 fr.]

***Télégraphie sans Fil Appliquée à la Météorologie aux Previsions du Temps et à l'étude de la Physique du Globe.** A. Boutquin. [Brussels: *Veuve Ferd. Larcier*. 1911. Pp. 40. Price 1 fr.]

***Télégraphie sans Fil et la Téléphonie sans Fil.** F. Fontaine. [Liège: *Imprimerie La Meuse*. 1911. Pp. 115. Price 3 fr.]

BRAZIL.

Radiotelegraphia e sua applicaçao no Brasil. Francisco Bhering.

Radiotelegraphia no Brasil. Francisco Bhering. [*Imprensa Nacional.* 1914. Pp. 341.]

Telegraphia sem fio. Francisco Bhering. [*Typographia Nacional.* 1914. Pp. 101.]

Telegraphia sem fio e sens ultimos melhoramentos. Francisco Bhering. [*Typographia Nacional.* 1908. Pp. 52.]

Telegraphia sem fio e Cartographos Conferencia. Francisco Bhering. [*Typographia Esperança.* 1914.]

Telegraplio sem fio. Ricardo Frederico de Lima. [Rio de Janeiro: *Officina Typographica da Escola Gerson.*]

DENMARK.

Laerebog i traadlos Telegrafi. O. Lund Johansen. [Copenhagen K.: *G. E. C. Gad,* Vimmelskaftet, 32. Price 11.00 kr.]

Moderne Radiomodlagere Elektronrörets Teori og Anvenrelse. [Copenhagen K.: *G. E. C. Gad,* Vimmelskaftet, 32. Price 3.00 kr.]

FRANCE.

ABC de T.S.F. [Paris: *S.T.M.*, 57, Rue de Vanves. 1921. Pp. 35. Price 3.50 fr.]

Appareils et Installations Télégraphiques. E. Montoriol, with a Preface by M. Blondel. [Paris: *Librairie J. B. Bailliere et Fils.* 1921. Pp. 625, with 440 figures. Price 40 fr.]

Applications de la Télégraphie sans Fil. E. Rothé. [Paris: *Librairie Beger-Levrault,* 5-7, Rue des Beaux-Arts. Fourth edition. 1918. Price 6.80 fr.]

Applications de la Télégraphie sans Fil. P. Jégou. [Paris: *Librarie Desforges* 29, Quai des Grands-Augustins. Pp. 70. Price 2.25 fr.]

***Carnet d'Enregistrement des Dépêches Météorologiques transmises par Télégraphie sans Fil.** [Paris: *O. Michel,* 22, Rue Huyghens. 2nd edition. Price 1 fr.]

Cours Élémentaire de Télégraphie sans Fil. G. Viard. [Paris: *Librairie de l'Enseignement Technique.* 3, Rue Thénard. 1918. Pp. 300. Price 15 fr.]

Cours Technique du Centre d'Instruction pour Élèves-Officiers Radiotélégraphistes. [Paris: *Imprimerie Nationale.* 1918. Pp. 180+336+209.]

Éléments de Télégraphie sans Fil Pratique. F. Duroquier. [Paris: *Dunod,* 47-49, Quai des Grands-Augustins. 2nd edition. 1920. Pp. 130. Price 7 fr.]

Étude de quelques Problèmes de Radiotélégraphie. H. de Bellescize. [Paris: *Gauthier-Villars et Cie.,* 55, Quai des Grands-Augustins. Pp. 174. Price 16 fr.]

Introduction à le Théorie des Courants Téléphoniques et de la Radiotélégraphie. J. B. Pomey. [Paris: *Gauthier-Villars et Cie.,* 55, Quai des Grands-Augustins. Pp. xiv+510. Price 50 fr.]

La direction des Avions par Télégraphie sans Fil. M. Percheron. [Paris: *Librairie Ernest Leroux.* Pp. 60. Price 2 fr.]

La Mémoire instannée des signaux Morse. Hausser. [Paris: *Etienne Chiron,* 40, Rue de Seine. 1921. Price 6 fr.]

La Théorie et la Pratique des Radiocommunications. Vol. I. Introduction à l'Étude des Radiocommunications. Léon Bouthillon. [Paris: *Librairie Delagrave.* 1919. Pp. ix+193. Price 20 fr., or 28 fr. cloth.]

La Théorie et la Pratique des Radiocommunications—Vol. II. La Propagation des Ondes Électromagnetiques à la Surface de la Terre. Léon Bouthillon. [Paris: *Librairie Delagrave.* 1921. Pp. xv+340, with 133 figures. Price 20 fr.]

Les Applications de la Physique pendant la Guerre. H. Vigneron. [Paris: *Masson et Cie*, 120, Boulevard Saint-Germain. Pp. viii+322. Price 7 fr. net.]

Les Tubes à Vide en Radiotélégraphie. P. Dapsence. [Paris XIe: *G. Péricaud*, 85, Boulevard Voltaire. Second edition. 1921. Pp. 49. Price 2.50 fr.]

Lexique Technique Anglais-Français. Lieut. G. Malgorn, in collaboration with M. Desmarets. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. 1920. Pp. xxi + 216. Price 10 fr.]

Livre de l'Amateur de T.S.F. Joseph Roussel. [Paris: *Vuibert*, 63, Boulevard Saint-Germain. 1921. Pp. 304. Price 15 fr.]

Longueurs d'Onde et Propagation. M. Vieillard. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. 1921. Pp. xii+416. Price 55 fr.]

Manuel Éléméntaire de Télégraphie sans Fil. C. Tissot. [Paris: *Augustin Challamel*, 17, Rue Jacob. 1918. Price 12 fr.]

Manuel pratique de Télégraphic sans Fil. L. Berranger. [Paris: *Etienne Chiron*, 40, Rue de Seine. 1921. Pp. 110, with 53 figures. Price 3 fr.]

Manuel théorique et pratique de Télégraphie sans Fil terrestre et Maritime. J. Galopin. [Paris: *Bernard Tignol*. 53 bis, Quai des Grands-Augustins. Second edition. 1919. Pp. vii+366. Price 9 fr.]

Mémoire facile de l'induction entre spires. P. Dapsence. [Paris XIe: *G. Péricaud*, 85, Boulevard Voltaire. Price 0.50 fr.]

Notions Élémentaires de Télégraphie sans Fil et Construction pratique de Postes Récepteurs. Jean Rémaur. [Paris: *Librairie Desforges*, 29, Quai des Grands-Augustins. 1921. Pp. 116. Price 7.50 fr.]

Notions Élémentaires et Pratiques de T.S.F. A l'usage des personnes voulant recevoir les signaux horaires et les dépêches météorologiques de la Tour Eiffel. E. Baudran. [Paris: *L. Geisler*, 1, Rue de Médicis. Price 3.75 fr.]

Notions générales sur la Radiotélégraphie et la Radiotéléphonie. R. de Valbreuze. [Paris: *La Lumière Electrique*, 142, rue de Rennes. Sixth edition. 1914. Pp. 475. Price 15 fr.]

Nouveau Traité Pratique de T.S.F. P. le Graverend. [Paris, XIe: *G. Péricaud*, 85, Boulevard Voltaire. Eighth edition. Pp. 80. Price 2 fr.]

Oscillations Électriques (Principes de la Télégraphie sans Fil). C. Tissot. [Paris, VIe: *Gaston Doin*, 8, Place de l'Odéon. Second edition.]

Oscillations Électro-magnétiques et la Télégraphie sans Fil. J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: *Gauthier-Villars et Cie*, 55, Quai des Grands-Augustins. 2 vols. Price 34 fr. each.]

Précis de Télégraphie sans Fil. J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. Price 24 fr.]

Premières Notions de Télégraphie et de Téléphonie sans Fil. Bégébé. [Paris: *Bibliothèque Omnia*, 20, rue Duret. Pp. 96. Price 4 fr.]

Principes Élémentaire de Télégraphie sans Fil. R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12-13, Henrietta Street, W.C.2. Pp. xii+249. Price 9s.]

Radiotélégraphie, Notions et Conseils Pratiques. M. Magny. [Paris: *O. Michel*, 22, Rue Huyghens. Price 2 fr.]

Radiotélégraphie Pratique et Radiotéléphonie. P. Maurer. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. 1920. Pp. 386. Price 21 fr.]

Réception des Signaux Horaires Radiotélégraphiques. Bureau des Longitudes. [Paris: *Gauthiers-Villars et Cie*, 55, Quai des Grands-Augustins. Second edition. Price 5.50 fr.]

Relais et Amplificateurs. Paul Dapsence. [Paris: *Avenir de la T.S.F.*, 18, rue Caffarelli. Pp. 16. Price 0.60 fr.]

Signaux Horaires et Radiotélégrammes Météorologiques transmis chaque jour par la Tour Eiffel. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands Augustins. Price 2.50 fr.]

Technique de la Radiotélégraphie. Rein. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. Price 18 fr.]

Télégraphie sans Fil, Applications Pratiques des Oudes Éléctriques. A. Turpain. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augusins. Second edition, 1908. Price 24 fr.]

Télégraphie sans Fil. Berget. [Paris: *Hachette*, 79, Boulevard Saint-Germain. Price 5 fr.]

Télégraphie sans Fil. André Broca. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. Second edition. Price 8.00 fr.]

Télégraphie sans Fil. Jean Laurent. [Paris: *Henri Gautier*, 55, Quai des Grands-Augustins. Pp. 36. Price 0.15 fr.]

Télégraphie sans Fil. Lucien Fournier. [Paris: *Garnier frères*, 6, rue des Saints-Pères. 1912. Pp. 193. Price 2 fr.]

Télégraphie sans Fil. E. Coustet. [Paris: *Charles Mendel*, 118, Rue d'Assas. Pp. 100. Price 2 fr.]

Télégraphie sans Fil. E. Petit and L. Bouthillon. [Paris: *Librairie Delagrave*, 15, Rue Soufflot. Fourth edition. Pp. vii+304. Price 15 fr.]

T.S.F. et la Guerre. E. Sinturel. [Lyon: *Imprimeries Réunies*, 8, rue Rachais. 1917. Pp. 64. Price 3 fr.]

Télégraphie sans Fil et la Loi. A. Perret-Maisonneuve. [Paris: *H. Desforges*, 29, Quai des Grands-Augustins. Price 10.50 fr.]

***Télégraphie sans Fil (la Télémecanique et la Téléphonie sans Fil à la portée de tout le monde).** R. Monier. [Paris: *Librairie Dunod*, 47-49, Quai des Grands-Augustins. Pp. 242. Price 5.25 fr.]

Télégraphie sans Fil et les Ondes Éléctriques. J. Boulanger et G. Ferrié [Paris: *Librairie Berger-Levrault*, 5-7, Rue des Beaux Arts. Ninth edition, 1918. Pp. 487. Price 15 fr. Cloth, 20 fr.]

T.S.F. Manuel Pratique de l'Amateur. H. Chazelle. [Paris: *Librairie Desforges*, 29, Quai des Grands Augustins. Price 6 fr.]

T.S.F. par les Tubes à Vide. Pierre Louis. [Paris: *Librarie Vuibert*, 63, Boulevard Saint-Germain. 1920. Pp. 143. Price 6 fr.]

T.S.F. Vade-mecum de l'Amateur sans-filiste. S. Mariens. [Paris: *Librairie Amat.*, 11, Rue de Mézières. Price 5 fr.]

Télégraphie sans Fil (Réception des Signaux Horaires et des Télégrammes Météorologiques). Docteur P. Corret. [Paris: *Edition du Cosmos*, 5, Rue Bayard. Pp. 125. Price 2 fr.]

***Télégraphie sans Fil dans les Rapports Internationaux.** Devaux Jacques. [*A. Pedone*, 1914. Price 4.80 fr.]

Télégraphie sans Fil pour Tous. F. Duroquier. [Paris: *E. Orlhac*, 1, rue Dante. Pp. 66. Price 3 fr.]

T.S.F. Postes Récepteurs. E. Monier. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. Second edition. 1917. Pp. iv+122. Price 2 fr.]

Télégraphie et Téléphonie sans Fil. C. Gutton. [Paris: *Librairie Armand Colin*, 103, Boulevard Saint-Michel. 1921. Pp. 188. Price 5 fr., or 6 fr. bound.]

***Téléphonie sans Fil.** Scheidt-Boon. [Valenciennes: 36, Rue de Mons. 1914.]

Théorie de la T.S.F. par Analogies Mécaniques. P. Dapsence. [Paris, XIe: *G. Péricaud*, 85, Boulevard Voltaire. Second edition. Pp. 92. Price 1.75 fr.]

Théorie de Maxwell et les Oscillations Hertziennes. La Télégraphie sans Fil. H. Poincaré. [Paris: *Gauthier-Villars et Cie.*, 55, Quai des Grands-Augustins. Third edition. 1908. Pp. 100. Price 6 fr.]

Théorie Générale de l'Électromagnetisme. G. E. Pineau. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. Pp. 72. Price 7 fr.]

Théorie Simplifiée de la Télégraphie sans Fil. Verdurand. [Paris: *Dunod*, 47-49, Quai des Grands-Augustins. 1917. Price, 4 fr.]

Tubes à Vide. Paul Dapsence. [Paris XIe: *G. Péricaud*, 85, Boulevard Voltaire. Second edition. 1921. Pp. 50. Price 2.50 fr.]

Vocabulaire de Télégraphie et de Téléphonie sans Fil en Cinq Langues. H. Viard. [Paris: *Gauthier- Villars et Cie.*, 55, Quai des Grands-Augustins. Pp. x+108. Price 15 fr.]

GERMANY.

Das drahtlose Telegraphieren u. Fernsprechen. H. Thürn. [Berlin: *Rich. Dietze.* Third edition. 1921.]

Die Funkentelegraphie. C. W. Nollatz. [Berlin: *George Siemens.* Third edition, 1921.]

Die Neuere Entwicklung der Funkentelegraphie. H. Wigge. [Cothen-Anhalt: *Verlag der Ingenieur-Zeitung.* Second edition, 1921. Pp. v+71, with 59 illustrations.]

Drahtlose Telegraphie und ihr Einfluss auf den Wirtsschaftsverkehr, unter besonderer Berücksichtigung des Systems Telefunken. E. Vesper. [Berlin: *Julius Springer.* 1905. Price M. 4.95.]

Drahtlose Telegraphie. G. Eichhorn. [Berlin, W.10.: *Walter de Grayter & Co.* 1904. Price 5s.]

***Drahtlose Telegraphie und Telephonie.** G. Partheil. [Berlin: *Gerdes und Hödel.* Second edition, 1911. Price M. 6.]

Einführung in die Elektrotechnik Unter Zugrundelegung der Vorlesungen. Professor Slabys. Revised by Otto Nairz. [Leipzig: *J. A. Barth.* Pp. viii+415. Price M. 25.20.]

Einfuhrung in die moderne drahtlose Telegraphie und ihre Praktische Verwendung. Hugo Mosler. [Braunschweig: *Friedrich Vieweg und Sohn*, 1920. Pp. 240, with 218 figures. Price M. 24.]

Elektrische Lichtbogen. H. Th. Simon. [Leipzig: *Hirzel*, Konigstrasse, 2. 1911. Price 1s. 5d.]

***Elektrischen Wellentelegraphie.** O. Arendt. [Brunswick: *Fr. Vieweg und Sohn.* 1907. Price M. 10.5.]

***Elektromagnetische Schwingungen und Drahtlose Telegraphie.** J. Zenneck. [Stuttgart: *Ferd. Enke.* 1905. Price M. 28.]

Elektromagnetische Schwingungen und Wellen. Josef Geitler. [Braunschweig: *Vieweg u. Sohn*, 1921. Price M. 38.]

Entdeckungsfahrten in den elektrischen Ozean. A. Slaby. [Berlin: *Leonhard Simion.* 1911.]

***Experimentelle Untersuchungen aus dem Grenzgebiet zwischen drahtloser Telegraphie und Luftelektrizität.** M. Dieckmann. [Berlin: *Julius Springer.* 2 vols., 1912. Price M. 4.95.]

***Fortschritte auf dem Gebiete der drahtlosen Telegraphie.** A. Prasch. [Stuttgart: *Ferd. Enke.* 1906. Price M. 8.40.]

Frequenzmesser und Dämpfungsmesser. E. Nesper. [Berlin, W.10: *Walter de Grayter & Co.* 1907. Price, 11s.]

***Funkentelegraphie.** A. Slaby. [Berlin: *Julius Springer.* 1897. Price M. 2.]

Funkentelegraphie im Recht. H. Thurn. [Munich: *J. Schweitzer*, 1913. Price M. 6.]

Funkentelegraphie für Flugzeuge. E. Niemann. [Berlin: *R. C. Schmidt & Co.* 1921. Pp. 410, with 343 figures. Price M. 120.]

Grundriss der Funkentelegraphie in gemeinverstandlicher Darstellung. F. Fuchs. [Munich: *R. Oldenburg.* Eleventh edition, 1920. Pp. 73. Price 1s. 5d.]

Handbuch der drahtlosen Telegraphie und Telephonie. Eugen Nesper. [Berlin: *Julius Springer.* Two volumes. 1921.]

Handbuch für Funkentelegraphisten. O. Ohlsberg. [Berlin: *Decker.* Second edition, 1918.]

***Lehrbuch der Drahtlosen Telegraphie.** J. Zenneck. [Stuttgart: *Ferd. Enke.* 1916. Price M. 15.]

Lehrbuch der Drahtlosen Telegraphie und Telephonie. Franz Anderle. [Leipzig and Vienna: *Franz Deuticke.* Fourth edition, 1918. Price 8s. 5d.]

Leitfaden der Drahtlosen Telegraphie für die Luftfahrt. Max Dieckmann. [Munich: *R. Oldenburg.* Pp. 214. Price 7s. 2d.]

Lichtbogen als Wechselstromerzeuger. H. K. W. Wagner. [Leipzig: *S. Hirzel,* Königstrasse 2. 1910. Price 2s. 6d.]

***Physik des Aethers auf Elektromagnetischer Grundlage.** P. Drude. [Stuttgart: *Ferd. Enke.* New edition, edited by W. König. 1912. Price M. 16.]

***Physikalische Grundlagen der Elektrotechnik.** F. F. Martens. [Brunswick: *Vieweg und Sohn.* Second edition. Price M. 21.]

Radiotelegraphie. O. Nairz. [Leipzig: *J. A. Barth.* 1908.]

***Radiotelegraphische Gleichstrom-Tonsender.** H. Rein. [Berlin: *Julius Springer.* 1912.]

***Radiotelegraphisches Praktikum.** H. Rein. [Berlin: *Julius Springer.* Second edition, 1904. Price M. 8.]

Radiotelegraphisches Praktikum. H. Reim and K. Wirtz. [Berlin: *Julius Springer.* Revised edition. 1921. Pp. xviii+557. Price M. 120.]

***Telegraphie ohne Draht.** A. Righi and B. Dessau. [Brunswick: *Vieweg und Sohn.* Second edition, 1907. Price M. 24.75.]

***Telegraphie und Telephonie ohne Draht.** Otto Jentsch. [Berlin: *Julius Springer.* 1904. Price M. 5.]

***Telephonie ohne Draht.** H. Markau. [Brunswick: *Vieweg und Sohn.* Second edition, 1907. Price M. 7.8.]

Von Morse bis Marconi. A. Neuberger. [*Ullstein & Co.*]

Wellentelegraphie. Hanns Gunther. [Stuttgart: *Franckhsche Verlagshandlung,* 1921. Pp. 112, with 61 figures. Price M. 6.60, or M. 9.80 bound.]

GREAT BRITAIN.

A Catalogue of British Scientific and Technical Books (Including Wireless). Prepared by a Committee of the British Science Guild. [London: *The British Science Guild.* 1921. Pp. xviii+376. Price 10s. net.]

A Short Course in Elementary Mathematics and their Application to Wireless Telegraphy. S. J. Willis. [London: *The Wireless Press, Ltd.,* 12/13, Henrietta Street, W.C.2. 1917. Pp. 182. Price 5s.]

Admiralty Handbook of Wireless Telegraphy, 1920. [London: *H.M. Stationery Office.* 1920. Pp. viii+477. Price 7s. 6d. net.]

Alexanderson System for Radio Telegraph and Radio Telephone Transmission. Elmer E. Bucher. [New York: *Wireless Press Inc.,* London; *The Wireless Press, Ltd.,* 12-13, Henrietta Street, W.C.2. 1920. Pp. 55. Price 10s. 6d. net.]

Alternating Current Work. W. Perren Maycock. [London: *I. Pitman & Sons, Ltd.,* Parker Street, Kingsway, W.C.2. Second edition. Pp. 420, with 260 illustrations. Price 10s. 6d.]

Alternating Current Work: An Ontline for Students of Wireless Telegraphy. A. Shore, A.M.I.E.E. [London: *The Wireless Press, Ltd.,* 12/13, Henrietta Street, W.C.2. 1919. Pp. ix+163. Price 3s. 6d.]

Amateur Operator's Diary and Notebook 1920. [London: *The Wireless Press, Ltd.,* 12/13, Henrietta Street, W.C.2. Price 3s. 6d.]

Arithmetic of Telegraphy and Telephony. T. E. Herbert and R. G. de Wardt. [London: *Sir Isaac Pitman & Sons, Ltd.* 1921. Pp. vii+187, with 37 diagrams. Price 5s.]

Autobiography of an Electron. Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.,* 38, Great Russell Street, W.C.1. 1911. Pp. 215. Price 5s. net.]

Calculation and Measurement of Inductance and Capacity. W. H. Nottage, B.Sc. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1916. Pp. 144. Price 3s. 6d.]

Continuous Wave Wireless Telegraphy (Part I). W. H. Eccles, D.Sc. [London *The Wireless Press, Ltd.*, 1921. Pp. vii+407, with 306 diagrams. Price 25s. net.]

Decimal Tables. Sir G. L. Molesworth, K.C.I.E., M.Inst.C.E. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. 1919. Pp. 118. Price 2s. 6d.]

Directive Wireless Telegraphy, Direction and Position Finding, etc. L. H. Walter, M.A., A.M.I.E.E. [London: *Sir Isaac Pitman & Sons, Ltd.*, 1921. Pp. xii+124, with 57 diagrams and illustrations. Price 2s. 6d net.]

Electric Discharges, Waves and Impulses and other Transients. C. P. Steinmetz, A.M., Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.* Second edition. Pp. 167, with 72 illustrations. Price 12s. 6d. net.]

Electric Oscillations and Electric Waves. G. W. Pierce, Ph.D. [New York: *McGraw-Hill Book Co., Inc.*; London: *McGraw-Hill Publishing Co., Ltd.* 6/8, Bouverie Street, E.C. 4. Pp. ix+517. Price 25s. net.]

Electric Waves. H. Hertz. (Translated by D. E. Jones, B.Sc.). [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Second edition, 1900. Pp. 298. Price 12s. 6d.]

Electrician's Handy Book. T. O'Conor Sloane, A.M., E.M., Ph.D. [London: *Henry Frowde and Messrs. Hodder & Stoughton.* Fifth edition. 1920. Pp. 823. Price 27s. 6d. net.]

Electron Theory of Matter. O. W. Richardson. [London: *Cambridge University Press*, Fetter Lane, E.C.4. Price 21s.]

Electromagnetic Theory of Light. Part I. C. E. Curry, Ph.D. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 416. Price 12s.]

Electron Theory: a Popular Introduction to the New Theory of Electricity and Magnetism. E. E. Fournier-d'Albe, B.Sc. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. 1906. Pp. xxii+312. Price 7s. 6d.]

Elements of Electromagnetic Theory of Light. L. Silberstein, Ph.D. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. 1919. Pp. 48. Price 4s. 6d.]

Elements of Radiotelegraphy. Ellery W. Stone, Mem.I.R.E. [New York: *D. van Nostrand Co.* London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. 1920. Pp. vii+267. Price 16s. 6d. net.]

Elementary Lessons in Electricity and Magnetism. Silvanus P. Thompson, D.Sc., F.R.S. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. New edition. 1915. Price 5s. 6d.]

Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators. Dr. J. A. Fleming, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Third edition—New impression, 1919. Pp. xiv+355, with 194 illustrations. Price 10s. 6d.]

Elementary Practical Mathematics. F. Castle, M.I.M.E. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 4s.]

Elementary Principles of Wireless Telegraphy. Parts I and II. R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 212. Price 4s. each; in 1 vol., 7s. 6d.]

Elements of Electromagnetic Theory. S. J. Barnett, Ph.D. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 12s. 6d. net.]

Emission of Electricity from Hot Bodies. O. W. Richardson, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Second edition. 1921. Pp. viii+320, with 35 diagrams. Price 16s. net.]

Engineering Mathematics. C. P. Steinmetz, A.M., Ph.D. [London: *McGraw-Hill Publishing Co.*, 6/8, Bouverie Street, E.C.4. Third edition. Pp. 321. Price 17s. 6d. net.]

Experimental Wireless Stations. Philip E. Edelman, E.E. [London: *Henry Frowde and Messrs. Hodder & Stoughton.* Revised edition, 1920. Pp. x+392, with 166 illustrations. Price 16s. net.]

Experiments with Alternate Currents of High Potential and High Frequency Nikola Tesla. [New York: *McGraw-Hill Book Co., Inc* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E C.4. 1914. Pp. 174, with 42 illustrations. Price 5s.]

Fifty Years of Electricity. J. A. Fleming, M.A., D.Sc., F.R.S [London: *The Wireless Press, Ltd.* 1921. Pp. xi+371. Price 30s. net.]

Final Digest for Wireless Students. J. Henstock. [Glasgow: *Jas. Munro*, 60, Brown Street. Third edition. 1918. Pp. 90. Price 4s. 6d.]

Formulae and Tables for the Calculation of Alternating Current Problems. Louis Cohen. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 281. Price 17s. 6d.]

The Framework of Wireless Telegraphy: A New Theory of Electric Wave Sources and Propagation with Rational Applications. R. C. Galletti di Cadillhac. [London: *Crosby Lockwood & Son*, 1921. Pp. 48, with 6 diagrams. Price 3s. 6d. net.]

Handbook of Technical Instruction for Wireless Telegraphists. J. C. Hawkhead. Revised by H. M. Dowsett, M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second edition—Fifth impression, 1918. Pp. 344. Price 7s. 6d.]

***Handbook of Wireless Telegraphy.** Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 458, with 200 illustrations.] *New edition in preparation.*

High-Frequency Apparatus. By Thomas S. Curtis. [London: *Page & Co.* 1921. Pp. 269, with 150 diagrams. Price not stated.]

***Hints for Wireless Designs for Amateurs.** "Alfrec." [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. 1914. Pp. 55. Price 3s.]

History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century. Dr. E. T. Whittaker, D.Sc., F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Price 12s. 6d.]

How to Become a Wireless Operator. Charles B. Hayward. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Price 12s.]

How to Conduct a Radio Club. E. E. Bucher. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 148. Price 5s. net.]

How to Pass U.S. Government Wireless License Examinations. E. E. Bucher. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 5s. net.]

Intermediate Text Book of Magnetism and Electricity. G. F. Woodhouse, M.A. [Sedbergh, Yorks: *Jackson & Son.* Revised, with additions, 1919. Price 7s. 6d.]

Ionic Valve: a Guide to the Study of its Development and Application to Wireless Work. W. D. Owen, A.M.I.E.E. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. vii+59. Price 2s. 6d. net.]

Magnets and Electric Currents. J. A. Fleming, M.A., D.Sc. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. Third edition. 1902. Pp. xv+408, with 136 illustrations. Price 6s. net.]

Magnetism and Electricity for Beginners. H. E. Hadley, B.Sc. [London: *Macmillan & Co.*, St. Martin's Street, W.C.2. Price 3s. 6d.]

Magnetism and Electricity for Home Study. H. E. Penrose. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 515. Price 6s.]

Magnetism and Electricity for Students. H. E. Hadley, B.Sc. [London: *Macmillan & Co.*, St. Martin's Street, W.C.2. Price 7s.]

Maintenance of Wireless Telegraph Apparatus. P. W. Harris. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second impression, 1918. Pp. x+127. Price 2s. 6d.]

Making Wireless Outfits: an Explanation of the Construction and Use of an Inexpensive Wireless Equipment for Sending and Receiving up to 100 Miles. Newton Harrison, E.E. [London: *E. and F. N. Spon, Ltd*, 57, Haymarket, S.W.1. Second edition, 1918. Pp. 61. Price 2s. 6d. net.]

Manual de Instrucción Tecnica para Operadores de Telegrafia sin Hilos. J. C. Hawkhead and H. M. Dowsett. Translated by C. Ortega. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xvi+332. Price 9s. net.]

Manual of Radiotelegraphy. Captain S. S. Robison, U.S.N. [Annapolis, U.S.A.: *The United States Naval Institute.* London: *S. Rentell & Co., Ltd.*, 36, Maiden Lane, W.C.2. Fifth edition, 1919. Price 10s. net.]

Marine Wireless Pocket Book. W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2.] *In the Press.*

***Maxwell's Theory and Wireless Telegraphy.** H. Poincaré and F. K. Vreeland. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Price 10s. 6d.]

Methods of Measuring Electrical Resistance. E. F. Northbury, Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 390. Price 22s. 6d.]

Military Signal Corps Manual. Major J. A. White. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.* Price 12s. 6d. net.]

Miscellaneous Papers. H. Hertz. Translated by D. E. Jones and G. A. Schott. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 12s. 6d. net.]

Modern High-Speed Influence Machines, their Principles, Construction and Applications to Radiography, Radiotelegraphy, Spark Photography, Electro-Culture, Electro-Therapeutics, High-Tension Gas Ignition, the Testing of Materials, etc. V. E. Johnson, M.A. [London: *E. and F. Spon, Ltd.* 1921. Pp. viii+278, with 23 illustrations. Price 14s. net.]

Modern Theory of Physical Phenomena, Radio-activity, etc. Augusto Righi. Translated by A. Trowbridge. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 180. Price 6s.]

Morse Made Easy: a New Card for Rapidly Learning the Morse Code. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 3½d.]

Oscillation Valve. R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 215. Price 6s. net.]

Plans and Specifications for Wireless Telegraph Sets. A. F. Collins. Part I: One to Five Miles. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. New edition. 1915. Pp. 47, with 37 illustrations. Price 2s. 6d.]

Plans and Specifications for Wireless Telegraph Sets. Part II: Five to Ten Miles. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1912. Pp. 72 with 62 illustrations. Price 2s, 6d. net.]

Pocket Book (the Wireless Telegraphists') of Notes, Formulae and Calculations. (Containing Formulae, Tables and Examples of Calculations Required in Practical Radiotelegraphy.) J. A. Fleming, M.A., D.Sc., F.R.S. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1915. Pp. 347. Price 9s.]

Pocket Dictionary of Technical Terms Used in Wireless Telegraphy. Harold Ward. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. New edition, 1919. Pp. 253. Price 2s. 6d.]

Practical and Experimental Wireless Telegraphy. W. J. Shaw. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1914. Pp. 102, with 42 illustrations. Price 5s. net.]

Practical Telephone Handbook. J. Poole, A.M.I.E.E. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Sixth edition, with 585 illustrations. Price 15s. net.]

Practical Amateur Wireless Stations. Compiled by J. A. White. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 136. Price 5s. net.]

Practical Uses of the Wavemeter in Wireless Telegraphy. J. O. Mauborgne, [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 74. Price 6s. 3d.]

***Practical Wireless Slide Rule.** Dr. H. R. Hickman. [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. Price 3s. 6d.]

Practical Wireless Telegraphy. E. E. Bucher. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 352. Price 12s. 6d. net.]

Prepared Radio Measurements with Self-Computing Charts. Ralph R. Batcher, E.E. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1921. Pp. 132. Price 10. 6d. net.]

Principes Élémentaires de Télégraphie sans Fil. R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xii+249. Price 9s.]

Principios Elementales de Telegrafia sin Hilos. R. D. Bangay. Translated by C. Ortega. Parts I and II. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 10 pesetas (9s. net.)]

Principles and Practice of Electrical Testing as applied to Apparatus, Circuits and Machines. R. G. Allen, B.Sc., A.R.C.Sc.I., A.M.I.E.E. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Pp. 363. Price 18s. net.]

Principles of Electric Wave Telegraphy and Telephony. Dr. J. A. Fleming, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Fourth edition, revised 1919. Pp. xv+707. Price 42s. net.]

Principles of Radio Communication. J. H. Morecroft (Assistant Professor of Electrical Engineering, Columbia University), Assisted by A. Pinto and W. A. Curry. [New York: *John Wiley & Sons, Inc.* London: *Chapman & Hall, Ltd.*, 11, Henrietta Street, W.C.2. 1921. Pp. x+935. Price 45s. net.]

Principles of Radiotelegraphy. C. M. Jansky. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 242, with 179 illustrations. Price 12s. 6d. net.]

Principles of Wireless Telegraphy. G. W. Pierce, Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.* 6/8, Bouverie Street, E.C.4. Pp. 350, with 235 illustrations. Price 15s.]

Radio Communication. John Mills. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1918. Pp. 210. Price 10s.]

Radiodynamics. B. F. Meissner. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 206. Price 12s.]

Radio Engineering Principles. H. Lauer, B.S., and H. L. Brown, B.E.E. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C. 4. Pp. xv+300. with 250 illustrations and 8 plates. Price 17s. 6d. net.]

Radio Instruments and Measurements. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henriteta Street, W.C.2. Pp. 320. Price 9s. net.]

Radiotelegraphy. C. C. F. Monckton. [London: *Constable & Co.*, 10/12, Orange Street, Leicester Square, W.C.2. 1908. Pp. 289. Price 7s. 6d.]

Radiotelephony. A. N. Goldsmith, Ph.D. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 256. Price 15s. net.]

Radio Questions and Answers. A. R. Nilson. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4 1922. Pp. 92. Price 5s. net.]

Radio-Telegraphist's Guide and Log Book. W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Price 5s. 6d. net.]

Scientific Ideas of To-day. Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.*, 38, Great Russell Street, W.C.1. Pp. 344. Price 7s. 6d. net.]

Selected Studies in Elementary Physics. A Handbook for the Wireless Student and Amateur. E. Blake, A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. viii+176. Price 5s. net.]

Selenium Cells. T. W. Benson. [London: *E. & F. W. Spon, Ltd.*, 57, Haymarket, S.W.1. 1919. Pp. 68, with 18 illustrations. Price 7s. 6d. net.]

Simple Fault Tracing for Wireless Students and Operators. S. W. Brown. [Glasgow: *Jas. Munro*, 60, Brown Street. 1919. Pp. 414. Price 1s. 6d.]

Standard Tables and Equations in Radiotelegraphy. Bertram Hoyle. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 159. Price 9s.]

***Story of Wireless Telegraphy.** Alfred T. Story. [London: *Hodder & Stoughton*, St. Paul's House, Warwick Square, E.C.4. Pp. 225. Price 1s.]

Studies in Terrestrial Magnetism. Dr. C. Chree, F.R.S. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 6s. 6d.]

Submarine Telegraphs, with an Appendix on Wireless Telegraphy. Charles Bright, F.R.S.E. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 800. Price £3 3s.]

Telegraphy, Telephony and Wireless. Joseph Poole. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. 120, with 68 illustrations. Price 3s. net.]

Telephony without Wires. P. R. Coursey, B.Sc., A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xi+414. Price 15s. net.]

Telephonic Transmission, Theoretical and Applied. J. G. Hill. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Pp. xvi+398. with 196 diagrams. Price 21s. net.]

Test Questions in Wireless Telegraphy. In Card Form: Three Series. (These Test Cards are based on the "Elementary Principles of Wireless Telegraphy," "Handbook of Technical Instruction for Wireless Telegraphists," and other well-known textbooks.) [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 2s. 6d. each series; answers separate.]

Textbook on Wireless Telegraphy. R. Stanley, B.A., M.I.E.E. In 2 vols.: (I) General Theory and Practice: pp. xiii+471, with 255 figures; (II) Valves and Valve Apparatus; pp. viii+357, with 227 figures. [London *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. 1919. Price 15s. each vol.]

Theory and Calculation of Transient Electric Phenomena and Oscillations. C. P. Steinmetz, A.M., Ph.D. [London : *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Third edition. 1920. Pp. 696, with 113 illustrations. Price 30s. net.]

Thermionic Valve and its Developments in Radiotelegraphy and Telephony. J. A. Fleming, D.Sc., F.R.S. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xv+280. Price 15s.]

Thermionic Tubes in Radiotelegraphy and Telephony. John Scott-Taggart, A.M.Am.I.E.E. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1921. Pp. xxiii+424, with 344 diagrams. Price 25s. net.]

The Signal Service in the European War of 1914-1918 (France). R. E. Priestley, M.C., B.A. (late Major R.E.). Published by the Secretary of the Institution of Royal Engineers, and by the Signals Association. [Chatham : *W. & J. MacKay & Co., Ltd.* 1921. Pp. xvi+350. Price not stated.]

The Thermionic Vacuum Tube and its Applications. H. J. van der Bijl. [New York : *McGraw-Hill Book Co., Inc.*, London : *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1921. Pp. 301, with 232 illustrations. Price 25s. net.]

Useful Notes on Wireless Telegraphy. H. E. Penrose. In Five Booklets. Book I, "Direct Current," pp. 65; Book II, "Alternating Current," pp. 50; Book III, "High Frequency Current and Wave Production," pp. 66; Book IV, "The Marconi 1½ kW Ship Set," pp. 77; Book V, "The Oscillation Valve," pp. 53. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Price 1s. 4d. each.]

Vacuum Tubes in Wireless Communication. E. E. Bucher. [New York : *Wireless Press Inc.* London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 202. Price 12s. 6d. net.]

Waves and Ripples in Water, Air and Aether.—Being a Course of Lectures delivered at the Royal Institution of Great Britain. J. A. Fleming, M.A., D.Sc., F.R.S., etc. [London : *Society for Promoting Christian Knowledge*, 6, St. Martin's Place, W.C.2. Pp. 300. Price 7s. 6d.]

Wireless Design and Practice. Part I.—Transmitters and Receivers. Part II.—Practical Circuits. M. B. Sleeper. [London : *Henry Frowde and Messrs. Hodder & Stoughton.* 1920. Pp. 246. Price 7s. 6d.]

Wireless Experimenter's Manual, Incorporating How to Conduct a Radio Club. Elmer E. Bucher. [New York : *Wireless Press Inc.* London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1920. Pp. 335. Price 12s. 6d. net.]

Wireless Explained. F. Cross. [Glasgow : *James Brown*, 52/58, Darnley Street, Pollokshields. 1918. Pp. 72. Price 3s. 6d.]

Wireless Operator's Diary and Note Book. Published annually. A Leather Pocket-Book, with Diary and Notebook specially ruled for Wireless Operators. [London : *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1920. Price 3s. 6d.]

Wireless Telegraphy: Its History, Theory and Practice. A. F. Collins. [New York : *McGraw-Hill Book Co., Inc.* London : *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouveric Street, E.C.4. Pp. 300, with 332 illustrations. Price 15s. net.]

Wireless Telegraphy. Professor C. Fortescue. [London : *Cambridge University Press*, Fetter Lane, E.C.4. Price 2s. 6d. net.]

Wireless Telegraphy. Gustav Eichhorn, Ph.D. [London : *Charles Griffin & Co., Ltd.*, 12, Exeter Street, W.C.2. 1906. Pp. x+116. Price 10s. 6d. net.]

Wireless Telegraphy. W. H. Marchant. [London : *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Second edition, 1920. Pp. ix+305, with 201 illustrations. Price 7s. 6d.]

Wireless Telegraphy and Hertzian Waves. S. R. Bottone. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Fifth edition, revised by C. Sylvester, A.M.I.E.E. Price 3s. 6d. net.]

Wireless Telegraphy. J. Zenneck. Translated by A. E. Seelig, M.Am.I.E.E. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 428, with 461 illustrations. Price 25s. net.]

Wireless Telegraphy: With Special Reference to the Quenched Spark System. B. Leggett, A.M.I.E.E. [London: *Chapman & Hall, Ltd.*, 11, Henrietta Street, W.C.2. 1921. Pp. xv+385. Price 30s. net.]

Wireless Telegraphy: A Handbook on the Fundamental Principles and Modern Practice of Radiotelegraphy for the use of Students of Electrical Engineering. A. B. Rolfe-Martin. [London: *A. & C. Black, Ltd.*, 4/6, Soho Square, W.1. 1914. Pp. 256. Price 3s. 6d.]

Wireless Telegraphy and Telephony: An Outline for Electrical Engineers and Others. L. B. Turner, M.A., M.I.E.E. [London: *The Cambridge University Press.* 1921. Pp. xii+195. Price 20s. net.]

***Wonders of Wireless Telegraphy and Telephony.** Wm. J. White. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. 202. Price 4s.]

Wireless Telegraphy and Telephony: A Popular Account. Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.*, 28, Great Russell Street, W.C.1. Pp. 156. Price 3s. 6d. net.]

Wireless Telegraphy and Telephony: A Handbook of Formulae, Data and Information. W. H. Eccles, D.Sc. [London: *Benn, Bros., Ltd.*, 8, Bouverie Street, E.C.4. Third edition. 1920. *New and enlarged edition in preparation.*]

Wireless Telegraphy and Telephony: First Principles, Present Practice and Testing. H. M. Dowsett, M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xxxi+331. Price 9s. net.]

Wireless Telegraphy: its Theory and Practice. Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Sixth edition. Pp. 450, with 200 illustrations. Price 12s. 6d. *New edition in preparation.*]

Wireless Telegraphy Simply Explained. H. T. Davidge. [London: *Percival Marshall & Co.*, Farringdon Street, E.C.4. Pp. 63. Price 9d.]

Wireless Telephony. Ernst Ruhmer. Translated by Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 338. Price 10s. 6d.]

Wireless Telephone Construction. Newton Harrison. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. Pp. 74, with 43 illustrations. 1918. Price 2s. 6d.]

Wireless Telephones and How They Work. Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 76. Price 3s.]

Wireless Time Signals. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1915. Pp. 132, with 30 illustrations and 1 plate. Price 5s.]

Wireless Transmission of Photographs. Marcus J. Martin. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Revised, 1919. Pp. xv+142. Price 5s.]

Wonders of Wireless Telegraphy Explained in Simple Terms for the Non-technical Reader. J. A. Fleming, M.A., D.Sc., F.R.S. [London: *Society for Promoting Christian Knowledge*, 6, St. Martin's Place, W.C.2. Second edition, revised. Pp. 280. Price 7s. 6d.]

GREECE.

Elementary Treatise on Wireless Telegraphy. Captain C. Athanasiadis. [Publishers: *Government Press.*]

Handbook of Wireless Telegraphy. Vol. 2. Captain C. Athanasiadis. [Publishers: *Government Press.*]

HOLLAND.

De Internationale Organisatie van het Radio-electrische Verkeer. G. F. van Dissel. [Leyden: *A. W. Sythoff's Uitgeversmaatschappij.* Pp. 48. Price fl. 0.50.]

De Marconi Telegrafie. H. O. Ruyter de Wildt.

De theoretische grondslagen van Magnetisme en Electriciteit. Dr. Ir. N. Koomans. [The Hague: *N. Veenstra.* Price fl. 3.50.]

Draadlooze Telegrafie. J. R. G. Isbrücker. [Rotterdam: *Nygh en Ditmar,* Second edition. Price fl. 1.90.]

Draadlooze Telegrafie en hare toepassingen in Nederlandsch Oost-Indie. M. F. Onnen. [Leiden: *E. J. Brill.*]

Draadlooze Telegrafie. Edw. Vosmaer. [Baarn: *V. d. Ven.* Price fl. 0.75.]

Draadlooze Telegrafie en Telefonie. N. Koomans. [Deventer: *Kluwer.* Price fl. 1.75.]

Draadlooze Telegrafie over den Atlantischen Oceaan. I. van Dam.

Handleiding voor de uitoefening van den Radiotelegraafdienst. A. Walrave. [*W. Kruijt.* Eighth edition. Price fl. 2.00.]

Het draadloos amateurstation voor den ontvangst van telegrafie en telefonie. J. Corver. [The Hague: *N. Veenstra.* Price fl. 3.75 and fl. 5.0.]

Het draadloos zendstation voor den amateur. J. Corver. [The Hague: *N. Veenstra.* 1920. Pp. 106. Price fl. 3.60.]

La Telegraphie sans Fil. I. van Dam.

Leerboek voor aans Radiotelegraafisten en Stuurleiden. L. F. Steehouwer. [*Noorduyn Gorinchern.* Parts I and II. Pp. 136.]

Onderzoekingen op het gebied vam Radiotelegrafie in Nederlandsch Oost-Indie. ['s Gravenhage: *Martinus Nyhoff.* 1916. Three vols. Pp. 284. Price fl. 7.50.]

Radiotelegraphie in de tropen. Dr. C. J. de Groot. [The Hague: *Veenstra.* 1916. Pp. 247. Price fl. 7.50.]

Technische Handleiding voor Adspirant Radiotelegrafisten. A. K. Damstra and A. Walrave. [*Published by the Authors.* Third edition. Price fl. 3.50.]

ITALY.

Elementi di Telegrafia senza fili. P. Barreca. [Leghorn: *Raffaello Giusti.*]

Il Radiogoniometro e la Radiotelegrafia Direttiva. [Rome: *Ufficio Marconi.*]

La Telefonia senza filo. Umberto Bianchi. [Milan: *Ulrico Hoepli,* Pp viii+296. Price L. 10.]

L'Ottica delle Oscillazioni Elettriche. Augusto Righi. [Bologna: *Nicola Zanichelli.* Price L. 5.]

Manuale pratios del radiotelegrafista. G. Della Santa. [Milan: *Ulrico Hoepli.* Pp. 171. Price L. 6.50.]

Nozioni Elementari di Radiotelegrafia. [Rome: *Ufficio Marconi.*]

Progressi e stato attuale della Telegrafia e Telefonia senza fili. Giuseppe Vanni. [Rome: *Fratelli Capaccini.*]

Radiotelegrafia e Radiotelefonia. D. Mazzotto. [Milan: *Ulrico Hoepli.* Second edition. Price L. 6.]

Radiotelefonia. D. Ravalico. [Turin: *S. Lattes.* 1920. Pp. vii+219. Price L. 14.]

Telegrafia senza fili. O. Murani. [Milan: *Ulrico Hoepli.* Third edition. Pp. 520. Price L. 10.]

JAPAN.

Japanese Wireless Year-Book. Musen Nenkan. [Tokyo: *Musen News Agency,* 15, Sakuradabizencho, Shiba.]

***Popular Wireless Telegraphy and Telephony.** Masajiro Kitamura and Eiggoro Tsumori. [Tokyo: *Hobunkan,* Honkokucho Nihonbashiku. Price yen 4.5.]

Principles of Wireless Telegraphy and Telephony. Dr. Binnojo Mizuno. [Tokyo: *Marzuen Co.*, Tori 3 Chome, Nihonbashiku. 2 vols. Price yen 5.5.]

Stories of Wireless Telegraphy and Telephony. Eitaro Yokoyama. [Tokyo: *Denyusha*, Minamikinrokucho, Kyobashiku. Price yen 0.7.]

Wireless Telegraphy. Shunkichi Kimura. [Tokyo: *Uchita Rokakuko*, Otenmacho, Nihonbashiku. Price yen 2.0.]

Wireless Telegraphy and Telephony. Dr. Wichi Torikata. [Tokyo: *Hobunkan*, Honkokucho, Nihonbashiku. Price yen 5.500.]

Besides these there are a number of reports on wireless operations published by the Electro-Technical Laboratory.

NORWAY.

Elementœr Radiotelegrafi. (Handbook for Wireless Operators.) B. L. Gottwaldt. [Christiania: *H. Aschehoug and Co.* Second edition. 1918. Price kr. 5.00.]

Instructions to Government Wireless Operators. Issued by the Engineer in Charge of Wireless Section of the Norwegian Telegraph Department.

***Wireless Telegraphy Manual.** Captain Hovland. Issued for use in Norwegian Navy. 1907.

PORTUGAL.

Biblioteca do Instruccao Profissional. Elemento do Electricidade com um capitulo que trata de T.S.F. Ex. $1.60.

Telegraphia Electrica Aeria Submarina e Sem Fios. B. Ferrini. Translated by Adalberto Veiga, 1910. Ex. $1.00.

AMATEUR AND EXPERIMENTAL WIRELESS

BY HUGH S. POCOCK (*late Captain, R.E.*).

THE wireless worker who falls under the general classification of amateur must be divided into two distinct classes. There is the amateur who takes up wireless merely for the reason that it affords him amusement and is in the nature of a pastime, and the serious worker, who, though not directly engaged in the commercial development of the art, is, nevertheless, devoting his energies to the study, from a scientific point of view, of this new subject, which has already accomplished so much, and for which so great a future is expected.

Unfortunately, the term amateur is sometimes used to express a state of inefficiency, or incomplete knowledge of a subject, and the distinction between the amateur and the professional has become too strongly marked.

In wireless we might describe the amateurs as those who, being not necessarily engaged in the commercial side of wireless, are yet enthusiastic workers and experimenters in the science.

During the past year there has undoubtedly been a very large increase in the number of active amateurs in this country, and this number is increasing daily. There are many contributary causes to this increase in the popularity of wireless. The subject is one which has a special fascination, and those who once become devotees of the subject seldom lose their enthusiasm. It is a subject which can be studied without any heavy financial outlay in the purchase of apparatus, and quite efficient experimental apparatus is within the reach of almost everyone. Probably the strongest appeal, when first taking up wireless, is made by the fact that telephonic communication is now so far developed that any amateur listening-in in the evenings can hear music and speech transmitted, even though perhaps he does not himself contribute to the transmissions.

Since the General Post Office resumed the granting of licenses for the conduct of experiments in wireless telegraphy and telephony (these licenses having, of course, been suspended during the war), amateur wireless clubs have grown up all over the country and the number of these clubs has increased particularly during the past year. At about the end of 1920, there were 58 clubs in existence, of which 24 were affiliated with the Wireless Society of London. At the end of 1921, the total number of clubs was approximately 85 and 60 of these were affiliated with the Wireless Society of London, that is to say, more than the total number of clubs in existence at the end of the preceding year.

The second annual conference of Wireless Societies of this country was convened by the Wireless Society of London on March 1st, 1921, and on this occasion practically all the societies affiliated with the Wireless Society of London sent delegates to represent their particular societies. Commander Loring was present at the conference in the capacity of a Vice-President of the Wireless Society of London, but as a prominent official of the Post Office he was able to explain the position of the Post Office with regard to the licensing of amateur wireless, particularly in respect of transmitting permits, and the absolute necessity for some efficient control was made clear, although sympathy was expressed with those who, perhaps by reason of the unfavourable location of their stations, sought for licenses to use larger aerials or greater power in transmitting. It was shown that in exceptional cases the authorities had been prevailed upon to give special facilities to *bona fide* experimenters, whose qualifications ensured that they would not,

through ignorance or lack of experience, interfere with the conduct of wireless in commercial work and in the Services.

A remarkable feature of the progress of amateur wireless in this country is the very high grade of most of the papers read before societies, and the fact that the majority of the members are able to take an intelligent interest in discussions of theoretical points of a far from elementary nature. Perhaps this high standard may be partly attributed to the numerous and efficient text-books on wireless which are now available to students, and which are so graded that it is possible to find a publication applicable to a student of wireless in almost any stage of advancement in the subject.

The *Wireless World*, as the official organ of the Wireless Society of London and affiliated societies, continues to publish, in full, the papers read before the London Society and proceedings of their meetings. A section of the magazine is devoted to the publication of the proceedings of all other wireless societies in this country, and a certain number of papers read before other societies are published in full.

The year 1921 marks a great step in the advancement of amateur wireless. Early in the year arrangements were made between the amateurs of the United States and the amateurs of this country for the transmission of short wave wireless signals across the Atlantic in an attempt to communicate without going outside the scope allowed by the licenses permitted by the respective Governments. The amateurs in the United States are allowed to use a power for transmitting varying up to a maximum of 1 kW., whereas in this country 10 watts is set as the usual limit by the authorities. For this reason, it was decided that the Americans should transmit, and the British amateurs endeavour to receive the signals sent. The transmissions took place in the early morning of February 2nd, 4th and 6th. A large number of amateurs on this side entered for the competition and a number of valuable prizes to be awarded to successful competitors were placed at the disposal of the judges by various firms dealing in wireless apparatus. The results of the test was, however, disappointing. Although signals were almost undoubtedly heard by one or two competitors on this side, nothing was readable, and the judges expressed the opinion that not one entrant had received a single word or signal which could *unquestionably* be attributed to an American station.

It was not permitted, however, that this lack of success should act as a deterrent from further effort. The American Radio Relay League, which is an important organisation of the amateurs in America, expressed a keen desire to try again at a later date, and another test was organised for December of the same year, Mr. Philip R. Coursey again acting in the capacity of organiser on this side of the Atlantic. So great was the enthusiasm shown by the amateurs of America that they voted a sum of money, through their League, to send over to this country one of their most prominent amateurs, Mr. Paul F. Godley, in order that he might himself endeavour to read the signals from this side with his own apparatus.

A large number of British amateurs entered for this second competition and considerable enthusiasm was shown in the tests, although the general opinion appeared to be that there was not much hope of more success than had attended the first attempt.

Contrary to expectations, however, a large amount of success has attended these efforts. From all parts of the country reports were received of varying degrees of success in the reception of the signals, and this success was confirmed by a comparison of the secret transmission schedule with the signals reported to have been received. In all, eight British amateurs received signals from the other side. The representative from America, perhaps by reason of the fact that the Authorities did not restrict him in the matter of aerials and location, was the most successful. In some cases it was possible to copy complete messages transmitted from the other side.

This achievement of amateur wireless has created widespread interest amongst wireless engineers and experts in all parts of the world. By this

attainment the amateur has, more than ever, justified his existence, and it is likely that the authorities who control the activities of the amateur in various countries will give greater consideration than hitherto to this section of the wireless community, and that the amateur himself may reap benefit in being given increased facilities for the conduct of his experiments.

The fact must not be overlooked that a very considerable amount of valuable research work has already been done by the amateurs, whilst the younger enthusiasts in particular are building up for themselves such a foundation of experience in radio work and general electrical knowledge as would take them a very long while to acquire through the ordinary channels of a scientific training.

The authorities in the United States were not slow to recognise the value of this training, which gave no expense to the Government and was available immediately when wireless men were required in the war. The British pre-war amateurs, too, found their experiences extremely valuable, since they were ready trained for the work which they were called upon to do in their military careers.

There are at present in the United States approximately 200,000 amateur wireless stations, 25,000 of which are transmitting stations as well as receiving stations. In the United Kingdom there are probably not less than 6,000 receiving stations, some 250 of which are licensed for transmitting as well. In other countries, such as France, Belgium and Holland, the amateurs are a strong body, organised into numerous societies, though, unfortunately, the authorities of some countries are not all able to see their way to giving the amateurs facilities for practical work. France, hitherto very severe in her attitude towards the licensing of amateur stations, has at last been prevailed upon to grant transmitting licenses in special cases, but it appears that it will be some time before the wireless workers of that country are able to enjoy anything like the freedom which exists in the United States, or even in this country.

Apart from the fact that the United States amateurs are given the facilities for using considerably greater power in transmission than is permitted to the amateurs of this country, there is yet another very marked difference between their licenses and those operating here. In the United States, the amateurs are not in any way restricted in the matter of the destination of their transmissions or in the nature of the communications. In this country, the amateur is only permitted to communicate with other amateurs, limited to a maximum of five, who undertake to conduct experiments with him and whose names are endorsed on his license. Nothing which is in the nature of a communication or private message is permitted to be sent, the only transmissions allowed being those which relate actually to the experiments being conducted. The fact that the American amateur is permitted to transmit private messages to his friends in different parts of the country and to relay messages for other amateurs whose stations are not powerful enough to communicate direct with distant friends, is a very strong factor in the popularity of wireless in that country, and if it were possible to grant to British amateurs the same permission, there is no doubt that a very considerable impetus would be given to amateur and experimental wireless here.

Then, perhaps, the present year might see not only the successful reception in this country of amateur signals transmitted from the other side of the Atlantic, but actual exchange of communications with short wave low powered amateur stations might be accomplished.

But these things are in the hands of the authorities, to whom we must look for whatever slackening in the present restrictions it may be found possible to effect. However important we may regard the work of the amateur, we must not allow ourselves to overlook the fact that there are others besides ourselves who undoubtedly have a prior claim to the use of the æther.

DIRECTORY OF WIRELESS SOCIETIES

THE following list has been brought as up to date as circumstances would allow. Wireless Societies, however, are constantly being formed, and it is possible that particulars may have been received too late for insertion. Every endeavour has been made to present a thoroughly reliable list, but no responsibility can, however, be accepted for any possible inaccuracies.

AUSTRALIA.

Wireless Institute of Australia (New South Wales Division)—*Pres.*, E. T. Fisk; *Hon. Sec.*, Malcolm Perry, Box 2, King Street Post Office, Sidney, N.S.W. Tels., City 7349, Randwick 93.

Wireless Institute of Australia (South Australian Division)—Adelaide: *Pres.*, Hambly Clark; *Hon. Sec.*, C. E. Ames. Age limit 16 years. Annual sub., 10s. 6d., payable half-yearly. Official Organ, *Sea, Land and Air.*

Wireless Institute of Australia (Victorian Division)—*Pres.*, Major W. J. Sheldon; *Hon. Sec.*, Capt. Roach-Pierson, Melbourne, Victoria.

Wireless Institute of Australia (West Australian Division)—*Pres.*, W. E. Coxon; *Hon. Sec.*, G. W. Dean, 27, Holyrood Street, West Leederville, Perth.

BELGIUM.

Antwerp Section—*Sec.*, M. A. Wust, A.C.G.I., 128, Avenue du Margrave, Antwerp.

Cercle Belge d'études Radiotélégraphiques—*Sec.*, M. de Wouters, 16, Rue Plétinckx, Brussels. Official Organ, *La T.S.F. Moderne.*

Radio Club de Belgique. Official Organ, *L'Electricité pour Tous.* 20, Rue du Canal, Brussels.

CANADA.

*Amateur Radio Club of Vancouver—*Sec.*, L. H. McKay, 536, 8th Avenue, W., Vancouver, B.C.

*Montreal Radio Association—*Sec.*, L. E. Hunton, 209, Wilson Avenue, Montreal, Canada.

*Ottawa Amateur Radio Association—*Sec.*, A. R. Gladden, 405, Wellington Street, Ottawa, Ontario, Canada.

Radio Club of Winnipeg—Kelvin Technical High School. *Hon. Pres.*, J. M. F. Wilson, B.Sc.; *Pres.*, J. R. Foster; *Sec. and Treas.*, E. A. Strong, Winnipeg. Number of Scholars: 40.

Regina Amateur Radio Association—*Hon. Sec.*, H. Miller, 2226, Searle Street, Regina, Sask.

The Radio Research Club of Canada—*Sec. and Treas.*, C. A. Culver, Ph.D., Hydro Electric Laboratories, 8, Strachan Avenue, Toronto, Ontario, Canada.

*Southern Ontario Radio Association—*Sec.*, D. Aitchison, 450, Janette Avenue, Windsor, Ontario, Canada.

The Hub City Radio Club (Saskatoon, Canada)—*Sec.*, Wm. Astin, 1312 Avenue C. North, Saskatoon, Sask., Canada.

The Sunday Leader Radio Club—*Sec.*, C. H. Starr, Windsor, Nova Scotia, Canada.

*Wireless Association of Ontario—*Sec.*, Wm. F. Choat, 241, Robert Street, Toronto, Canada.

**Affiliated with the American Radio Relay League.*

DENMARK.

Radiotelegrafist foreningen af 1917 (Skandinavisk) Copenhagen—Car Johansgade, 14—*Sec. and Treas.*, R.Rasmussen. Formed September 8th, 1917.

FRANCE.

Société Havraise de T.S.F. (*Affiliated with S.F.E.T.S.F.*)—*Sec.*, M. J. Jacquin, 27, Rue de la Paix, Le Havre.

Société Nantaize de T.S.F. (*Affiliated with S.F.E.T.S.F.*)—*Sec.*, M. Fonterreau, 19, Rue Contrescarpe, Nantes.

Association des Anciens Radios de 8e Génie—*Hon. Pres.*, M. le Général Ferrié; *Pres.*, M. Alain-Charles Boursin; *Sec.*, M. J. Raynaud, 230, Fbg. St. Martin, Paris.

Radio-Association Liancourt—*Sec.*, M. Pierre Douvry, 4, Rue des Arts et Métiers, Liancourt (Oise).

Société Ardennaise de Radiotélégraphie—Monsieur M. Thirriot, 6, Bord des deux Villas, Charleville, (Ardennes).

Radio Club Belfortain—*Pres.*, Monsieur Ch. Wandres, 31, Rue de Mulhouse, Belfort.

Radio Club de Bordeaux—*Sec.*, Monsieur M. Meunier, 90, Rue Paul Camelle, Bordeaux.

Radio Club Bordelais—20, Cours Pasteur, Bordeaux.

Société de Radiotélégraphie et de Preparation Militaire (S.R P.M.)—*Pres.*, Monsieur J. E. Lavigne, 44, Rue Gay Lussac, Paris.

Société Française d'Etude de Télégraphie et de Téléphonie sans Fil (*S.F.E.T.S.F.*)—*Sec.*, Monsieur Roussel, 12, Rue Hoche, Juvisy (Seine et Oise). Official Organ, *La T.S.F. Moderne.*

Rouen Section—*Sec.*, Monsieur A. Restout, 8, Rue de la Haie, Boisguillaume (Pres. Rouen).

Société Provençale de T.S.F.—*Sec.*, Monsieur Seksik, 47, Rue Reinard, Marseilles. (*Affiliated with S.F.E.T.S.F.*)

Société Quimpéroise d'Electricité et de T.S.F.—*Sec.*, Monsieur Picquenard, 19, Rue de Brest, Quimper, Finisterre.

Société Française Radio Sport—*Pres.*, R. Bourgnignon, 152, Avenue de Wagram, Paris (XVIIe).

Club Radio des Patronages Parisiens (C.R.P.P.)—*Sec.*, Monsieur A. Bonniere, 301, Rue Lecourbe, Paris.

Radio Club du Nord de la France—*Sec.*, Monsieur Bernast, 55, Rue Nauve, Roubaix.

Radio Club de la Côte d'Azur (Nice).—*Pres.*, Monsieur Leon Deloy, 55, Bvd. Montboron, Nice; *Vice-Pres.*, Monsieur Alexandra Prezeau, 25, rue Pertinax, Nice; *Sec.*, Monsieur Louis Paulouin, 46, Ave, St. Lambert, Nice; *Tres.*, Monsieur Besneux, 101, Bvd. Gambetta, Nice.

GREAT BRITAIN.

The Wireless Society of London—*Pres.* Admiral of the Fleet Sir Henry B. Jackson, G.C.B., K.C.V.O., F.R.S., D.Sc., M.I.E.E. *Hon. Sec.*, L. McMichael, 32, Quex Road, W. Hampstead, London, N.W. 6, Tel., *Hampstead* 8777. Meetings, fourth Wednesday in month, 6 p.m., at Institution of Electrical Engineers, Victoria Embankment. Official Organ, *The Wireless World.*

Aldershot and District Wireless Society—*Hon. Sec.*, Queen's Avenue, Aldershot.

*Altringham Wireless Society—*Hon. Sec.*, Breeze Crest, Plane Tree Road, Hale, Cheshire.

Birmingham Experimental Wireless Club—*Hon. Sec.*, F. S. Adams, 110, Ivor Road, Sparkhill, Birmingham.

*Blackpool and Fylde Wireless Society—*Hon. Sec.*, C. Sheffield Doog, The Poplars, 6, Seventh Avenue, South Shore, Blackpool.

**Affiliated with the Wireless Society of London.*

Bolton Wireless Society—*Hon. Sec.*, O. Stott, Moss Bank House, Smithills, Bolton.

*Borough of Tynemouth Y.M.C.A. Amateur Wireless Society, Y.M.C.A. Buildings, Bedford Street, N. Shields.

Bournemouth and District Radio Club—*Hon. Sec.*, T. H. Dyke, 2, Iris Road, Winton.

Bradford-on-Avon Wireless Society—*Hon. Sec.*, H. Helps, 4, Ivy Terrace, Bradford-on-Avon, Wilts.

*Bradford Wireless Society—*Hon. Sec.*, John Bever, 85, Emm Lane, Bradford.

*Brighton Radio Society—*Hon. Sec.*, D. F. Underwood, 68, Southdown Avenue, Brighton.

*Bristol and District Wireless Association—*Hon. Sec.*, 5, Pembroke Vale, Clifton, Bristol.

*Bristol Wireless Association—*Hon. Sec.*, Portishead Rectory, Somerset.

*Burton-on-Trent Wireless Society—*Hon. Sec.*, 66, Edward Street, Burton-on-Trent.

Cambridge and District Wireless Society—*Hon. Sec.*, H. W. Taylor, Camden House, Park Terrace, Cambridge.

*Cambridge University Wireless Society—*Hon. Sec.*, D. Wade, Post Office, Trumpington Street, Cambridge.

*The Cardiff and South Wales Wireless Society—*Hon. Sec.*, 16, Adamsdown Square, Cardiff.

*City and Guilds Wireless Society—*Hon. Sec.*, City and Guilds Engineering College, Exhibition Road, London, S.W.7.

City of London School Wireless Society—*Hon. Sec.*, J. H. Gawler, City of London School, Victoria Embankment, E.C.4.

*The Corinium Wireless Society—*Hon. Sec.*, The Old Vicarage, Cirencester.

Coventry Wireless Association—J. E. Bolus, 14, Coundon Road, Coventry.

*Cowes and District Radio Society, Pretoria, Castle Street, East Cowes, I.O.W.

The Cricklewood and Brondesbury Radio Club—*Hon. Sec.*, C. N. Green, 213, Fordwych Road, Cricklewood, N.W.2.

*Croydon Wireless and Physical Society—*Hon. Sec.*, B. Clapp, Meadmoor, Brighton Road, Purley.

*Dartford and District Wireless Society—*Hon. Sec., and Treas.*, E. C. Deavin, 84, Hawley Road, Wilmington, Dartford.

LIST OF WIRELESS TELEGRAPH COURSES IN COLLEGES AND SCHOOLS

(N.B.—Those schools marked with an asterisk (*) are devoted to the teaching of Radiotelegraphy and Telephony.)

School of College.	Duration of Course.	Fee.	Hours of Attendance.	Age (Most suitable). Years.	Remarks.
***AUSTRALIA** Marconi School of Wireless, 97, Clarence Street, Sydney, N.S.W., and 422/4, Little Colins Street, Melbourne, Vic.	8 months (Day), 16 months (Evening)	£50	0930–1630 1930–2130	18–26	Apparatus :—Marconi quenched spark and aircraft installation.
BELGIUM *Antwerp School of Radiotelegraphists, 5-7, Rue du Lombard, Antwerp, Belgium.	9 months	—	—	17–24	Schools owned by the Société Anonyme Internationale de T.S.F. for the training of operators required for service on board Belgian merchant vessels.
*Ostend School of Radiotelegraphists, Caserne des Pompiers, Rue de Bruges, Ostend, Belgium.	9 months	—	—	17–24	
BOLIVIA *Radiotelegraphic School, La Paz, Bolivia.	—	—	—	—	This school is under the direction of M. Humberto Asin, the Superintendent of Radiotelegraphy in Bolivia.
BRAZIL *Marconi School, 107, Rua 1° de Março, Rio de Janeiro.	—	35 Milreis (monthly)	1300–1600	18–25	This school is conducted by Marconi's Wireless Telegraph Co., Ltd.
CANADA *Marconi Wireless Telegraph Co. of Canada, Ltd., 93, King Street, East, Toronto.	—	$20·00 monthly (Day Classes). $10·00 monthly (Night Classes).	0930–1200 1330–1600 (Saturday excepted). 1930–2130 (Monday, Wednesday and Friday).	16 upwards.	½ kw. Canadian Marconi Cabinet, ½ kw. Canadian Marconi W/T. Set.
*Cassan's Wireless School, Toronto, Ontario.	—	$20·00 monthly (Day Classes). $10·00 monthly (Night Classes).	0930–1600 (Saturday excepted). 1930–2130 (Monday, Wednesday and Friday).	No age limit.	½kw. Marconi open type.
*Shaw's Wireless School, Toronto, Ontario.	—	$20·00 monthly (Day Classes). $10·00 monthly (Night Classes).	0900–1600 0900–1200 (Saturday) 1930–2130 (Monday, Wednesday and Thursday).	No age limit.	½kw. Canadian Marconi Cabinet.

LIST OF WIRELESS TELEGRAPH COURSES—*continued.*

School of College.	Duration of Course.	Fee.	Hours of Attendance.	Age (most suitable). Years.	Remarks.
*Marconi's Wireless Telegraph Co. of Canada, Ltd., Montreal, Quebec.	—	$15·00 monthly (Afternoon Classes). $10·00 monthly (Evening Classes).	1400–1700 (Daily) 1930–2200 (Monday, Wednesday and Friday, Saturday excepted).	16 upwards.	School located at Marconi factory, all types of apparatus available.
Canadian School of Telegraphy (Wireless, Cable and Landline Telegraphy), Halifax, N.S.	12 months	$100	0900–1200 1400–1600 (Daily) 1930–2130 (Nightly).	16–25	Marconi apparatus.
Western Collegiate Institute, Ltd., 119, Pender Street, W. Vancouver, B.C.		$25·00 monthly (Day Course). $10·00 monthly (Two nights per week).	0930–1530 (Daily) 1930–2130 (Nightly) (Saturday excepted).	15 upwards.	Marconi ½kw. cabinet set.
Kelvin Technical High School, Winnipeg.	—	$2·00 per term which fee is returned if student attends ¾ of lectures.	1930–2130 (Three Evenings Weekly). (No day classes).	14 upwards.	Composite apparatus.
St. John's College, Winnipeg.		$2·00 per term which fee is returned if student attends ¾ of lectures.	1930–2130 (Three Evenings Weekly) (No day classes).	14 upwards.	
CHINA					
At the Board of Communications, Chiao-tung-pu, Pekin.	—	—	0930–1130 1430–1630	17–22	Devoted solely to the teaching of wireless telegraphy. This school is used only for the training of engineers and operators in the employ of the Board of Communication, hence no fees are charged.
At the Board of War, Board of War, Pekin.	—	—	—	16–25	English is also taught at this school, in addition to wireless telegraphy and telephony. This school is used for training officers and men of the Army.
FRANCE					
*Ecolé de Radiotélégraphie du Champ de Mars, 69, Rue Fondary, Paris, (15e).	5–6 months	550 frs. [2]	Postal [1]	15–16	[1] Course mainly postal, but attendance arranged if desired. [2] Plus 20 per cent. out of France.
Ecolé Practique de Radio-electricité, 57, Rue de Vauves, Paris (14e).	11 weeks 5 months 5 months 11 weeks	—	6 hours per day. 2 hours per day. Correspondence. 1½ hours per day.		Eight days in the laboratory.
JAPAN					
Telegraph Training School, Meguro, Tohiyo	—	—	—	—	Jointly controlled by the telegraph and wireless groups.

LIST OF WIRELESS TELEGRAPH COURSES—*continued.*

School of College.	Duration of Course.	Fee.	Hours of Attendance.	Age (most suitable). Years.	Remarks.
GREAT BRITAIN					
*2nd Lt. E. Redpath, 19, Niger Street, Barrow-in-Furness.	5 complete lessons.	3 guineas	Postal	—	Postal Instruction Course in C.W. Wireless. Endorsement of existing P.M.G.'s Certificates.
Northern Polytechnic Institute, St. John Street, Clerkenwell, London, E.C.	—	30s.	Evenings (Various).	—	
International Correspondence Schools, Ltd., International Buildings, Kingsway, London, W.C.2.	Until proficient (max. allowed, 5 years).	17 guineas (Elementary Course, 10 guineas).	Postal	17–23	
British School of Telegraphy, Ltd., 179, Clapham Road, London, S.W.	12–15 months	—	0930–1630	17–24	Equipped Marconi's Wireless Telegraph Co., Ltd.
Leith Nautical College, Commercial Street, Leith, Edinburgh.	18–24 months.	£6	1000–1600 (Day). 1900–2100 (Evenings Wednesday excepted).	16–16½	
North Wales Wireless Schools, The Wireless College, Carnarvon and Colwyn Bay.	8–12 months.	Sea Course, 22 guineas. Land Course, 28 guineas.	0930–1230 1330–1530 No afternoon classes Tuesdays and Saturdays).	—	
*London Radio College, Stafford House, 82-83, High Street, Brentford.	12 months	35 guineas	0930–1230 1400–1700 (Saturday excepted).	15–24	
London Telegraph Training College, Ltd., 262, Earl's Court Road, London, S.W.5.	45 weeks (30 hours per week).	40 guineas (Day Course). 20 guineas (Evening Course).	0930–1230 1330–1630 (Saturday excepted). 1800–2000 (Saturday excepted).	16–24	
Technical School, Tavistock Road, Plymouth.	2 years	10 guineas	0920–1225 1400–1700 (Saturday excepted).	16	
*City School of Wireless Telegraphy, Ltd., 61, High Street, Manchester.	12 months (Day) 18 months (Evening).	21 guineas (Day Course). 15 guineas (Evening Course).	0900–1230 1400–1630 1900–2100 (Wednesday afternoons and Saturdays excepted).	18–24	There is also a Postal Instruction Course, fee £10, duration 3 months.
Limerick School of Wireless and Inland Telegraphy, 2, Catherine Place, Limerick.	9–12 months	17 guineas	1000–1330 1600–1900	17–25	
*Marconi School, Marconi House, Strand, London, W.C.2.	—	—	—	—	Private School.
*South Wales and West of England Wireless Training College, Ltd., Market Buildngs, St. Mary's Street, Cardiff	12 months	25 guineas (Day Course). 15 guineas (Evening Course).	0930–1230 1400–1630	17	

LIST OF WIRELESS TELEGRAPH COURSES—*continued.*

School of College.	Duration of Course.	Fee.	Hours of Attendance.	Age (most suitable). Years.	Remarks.
Municipal College, The Town Hall Square, Portsmouth.	1 or 2 years	5 guineas per session.	0900–1200 1400–1700 (Saturday excepted).	—	The one-year course is intended for students who have some electrical knowledge, and who are not less than 17 years of age.
Naval School, T.S. *Mercury*, Hamble, Hants.	1–3 years	1 guinea per quarter.	2–3 hours per week.	13–15	Wireless forms only a part of the training.
Northern Wireless College and Cable School, 8, Corporation Street, Belfast.	8 months (or until qualified). 10 months	30 guineas 20 guineas	0930–1230 1400–1630 1900–2100	16½–24	Under normal conditions amateur classes are held each Wednesday. It is hoped to reinstate these shortly.
Surrey Education Committee, Grangwood School, Haslemere, Surrey.	12 months	None	0900–1200 1330–1600	12–15	Course is in conjunction with school curriculum, telegraph and telephone demonstration apparatus.
***The British Radio Correspondence College, 100, Lancaster Road, East Ham, London, E.C.**	No limit	—	Correspondence Course.	16–35	
NEWFOUNDLAND					
***Marconi Wireless Telegraph of Canada, Ltd., St. John's, Newfoundland.**	—	—	1000–1200 1500–1700 (Daily).	15–25	Marconi apparatus.
SPAIN					
***Radio School, Plaza Gaspar del Pino No. 3, Cadiz.**	6 months	—	1600–1900 2100–2300	15–25	
***Preparatoria Telégrafos, Trinquete de Caballeros No. 18, Valencia.**	—		0900–1300 (Special hours if so desired).	16 upwards.	
***Academia Bellido, Calle del Mar 10, Valencia.**	9 months	—	0900–1300	16 upwards).	
***Academia, Teverga-Mas-Serrano, Luna 5, Madrid.**	—	—	17–21	15–30	
UNITED STATES					
***Radio Institute of America, 326, Broadway, New York.**	4–6 months	$20 month $15 month	1300–1700 1930–2130 (Saturday excepted).	16	Fully equipped laboratory.
***Radio Institute of America, New Call Building, New Montgomery Street, San Francisco, California.**	—	—	1300–1700 1930–2130 (Saturday excepted).	—	
***New York Wireless Institute, 258, Broadway, New York.**	—	—	(Correspondence Courses only).	16–30	Telegraphy course, 20 lessons. Telephony course, 5 lessons.
Philadelphia School of Wireless Telegraphy, 1,533, Pine Street, Philadelphia, Penna.	6 months	—	0930–1230 1930–2130 (Saturday, Tuesday, and Thursday evenings excepted).	18–30	
***National Radio Institute Inc., 1345, Pennsylvania Avenue.**	4–8 months	—	0800–1000 1400–1600 1900–2100 (Saturday excepted).	—	

LIST OF WIRELESS TELEGRAPH COURSES—*continued.*

School or College.	Duration of Course.	Fee.	Hours of Attendance.	Age (most suitable). Years.	Remarks.
*National Radio Institute Inc., corner Franklin and Howard Streets, Baltimore, Md.	4–8 months	—	0800–1000 1400–1600 1900–2100 (Saturday excepted).	—	
*Y.M.C.A. Radio School, 153, East 86th Street, New York, N.Y.	6 months (Day). 10 months (Evening).	—	0900–1500 1930–2130	20	
Dodge's Radio Institute, Valparaiso, Indiana.	5–6 months unlimited.	$85 $115	0800–1200 1300–1700 (Saturday excepted).	17–20	The Institute is a boarding establishment. Approximate board lodging, $6·85 per week. Fully equipped laboratory.
Eastern Radio Institute, 899, Boylston Street, Boston, Mass.	Complete Course 6 months. Advanced Course, 3 months. Complete Course, 9 months. Advanced Course, 6 months.	$120 $60 $90 $60	0900–1300 (Saturday excepted). 0900–1300 (Saturday excepted). Monday Wednesday and Friday, 1900–2100 Monday, Wednesday and Friday, 1900–2100	—	
*Southern Wireless Institute Inc., 423-425, Courtland Street, Baltimore, Md.	6 months (Day). 8 months (Night).	—	0900–1500 1900–2100	18	
*Central Radio School, 316, East 14th Street, Kansas City, Mo.	4 months	—	0800–1130 1330–1530 (Additional work in Experimental Station).	—	
Oregon Institute of Technology, Portland, Oregon.	6 months (or until examination passed).	$25·00 (Month). $12·50 (Evening), plus a deposit of $8·50.	0845–1310 (Saturday excepted).	—	Operated by the Portland, Oregon Y.M.C.A.
Y.M.C.A. Technical Schools, Central Building, Y.M.C.A. of Philadelphia, 1,421, Arch Street, Philadelphia, Pa.	6 months	$15·00 (Monthly). $85·00 (6 months in advance).	1930–2200 (Monday, Wednesday and Friday).	Any age.	
*School of Radiotelegraphy Dept. of Education, Y.M.C.A., Seattle, Wash.	6 months	—	0900–1600	16–25	
*Massachusetts Radio and Telegraph School, Inc., 18, Boylston Street, Cor. Washington, Boston 11, Mass.	6–7 months (Day). 9 months approx. (Evening).	$20·00 (Monthly). $100·00 (in advance). $10·00 (monthly).	0900–1300 (Saturday excepted). 1900–2100 (Monday, Wednesday and Friday).	16 upwards.	
VENEZUELA					
National School of Radiotelegraphy, Caracas, Venezuela.	—	—	—	—	For the provision of native operators for the Venezuelan Radiotelegraphic service.

CODE SECTION

(A) The Morse Code.

THE MORSE CODE

Two forms of Morse Code are in use, the "Continental Morse Code," and the "American Morse Code." The latter is now only officially recognised for use in land line telegraphs in America, so that the Continental Code is used universally in Radio work.

Continental Morse is a dot and dash system, every letter or symbol consisting of a combination of these. Considering as an element either a dot or a dash, no ordinary unaccented letter is represented by more than four elements. Some punctuation signs, numerals and whole words are represented by more than four elements.

Rules for formation of Continental Morse code:

These rules apply irrespective of the speed of transmission.

(1) The time occupied by a dash should be equal to that occupied by three dots.

(2) The time occupied by the interval between two elements of one letter or other symbol should be equal to the time occupied by one dot.

(3) The interval between two letters in a word should be equal to the time occupied by three dots.

(4) The interval between two words should be equal to the time occupied by five dots.
